1. Executive Summary

Cable & Wireless Seychelles (CWS) stands at a pivotal moment in its transformation journey. Having completed extensive discovery activities, validated multiple transformation initiatives, and articulated a clear ambition to become a Digital Service Provider (DSP), CWS now requires an integrated and execution-ready strategy to translate transformation intent into measurable business outcomes.

Capgemini's proposal is designed to build upon the significant groundwork already completed by CWS. Rather than repeating discovery exercises, our focus is on validating key findings, refining priorities, and developing a practical Digitalization and AI Strategy that accelerates CWS's transition from a traditional telecommunications operator to a data-driven, AI-enabled Digital Service Provider.

The discovery findings demonstrate that CWS's challenge extends beyond technology modernization. Fragmented data, disconnected workflows, limited operational visibility, manual reconciliations, and cross-functional coordination bottlenecks continue to constrain organizational agility, customer experience, and business performance. Addressing these challenges requires coordinated transformation across people, process, technology, data, governance, and culture.

Capgemini fully aligns with CWS's guiding principle:

Data before AI. Workflow before Automation. Integration before Scale.

Accordingly, our approach prioritizes establishing trusted data foundations, integrated processes, modern digital platforms, and robust governance mechanisms before scaling automation and AI capabilities. This ensures future investments are sustainable, scalable, and aligned to long-term business objectives.

What differentiates Capgemini is our ability to combine telecommunications expertise, business transformation leadership, enterprise architecture, workforce transformation, data strategy, and Responsible AI capabilities within a single integrated framework. We do not view digitalization, data, AI, operating model redesign, and organizational change as separate workstreams. Instead, we bring them together into a unified transformation blueprint that maximizes the value of existing investments, including the Microsoft ecosystem, Bon Espoir Tier IV Data Centre, Cerillion, LATRO Revenue Assurance capabilities, and the D365 Finance & Operations programme.

Our methodology spans nine interconnected transformation domains covering leadership and governance, organizational change, workforce transformation, customer experience, data and analytics, technology architecture, operational efficiency, commercial growth, and enterprise AI governance.

Key Outcome Pillars

1. Strategic Transformation

2. Business Growth & Operational Excellence

3. Data, Technology & AI Enablement.

4. Execution & Value Realization

The engagement will be delivered through a structured four-phase approach over 20 weeks, ensuring that recommendations are evidence-based, stakeholder-aligned, financially justified, and ready for execution.

The outcome will be a practical and sustainable transformation roadmap that enables CWS to move confidently from fragmented operations to an integrated, data-driven, AI-enabled Digital Service Provider, unlocking growth, operational excellence, trusted intelligence, and long-term competitive advantage for the Seychelles market.

As an additional commitment to CWS's success, Capgemini will provide senior leadership advisory support valued at **USD 90,000** as a complimentary value-added offering, providing executive guidance, stakeholder alignment, and strategic advisory support throughout the engagement at no additional cost.

2. Understanding of Engagement

Cable & Wireless Seychelles (CWS) is at a pivotal stage in its transformation journey. Having completed eight enterprise discovery exercises and established a portfolio of 57 transformation initiatives, CWS has already developed a strong understanding of its current-state challenges, future ambitions, and strategic priorities. Our understanding is that this engagement is not intended to repeat discovery activities, but to validate, refine, and transform the inherited baseline into an integrated, prioritised, and execution-ready 3-year Digitalization and AI Strategy. ,

We understand that CWS's ambition extends beyond technology modernisation. The objective is to establish the operating model, governance, capabilities, platforms, data foundations, and workforce readiness required to successfully transition from a traditional telecommunications operator into a modern Digital Service Provider capable of delivering superior customer experiences, operational excellence, data-driven decision-making, and sustainable revenue growth.

Our review of the inherited baseline indicates that CWS possesses significant strategic assets, including Cerillion, NI2, LATRO, Microsoft 365, Power Platform, Power BI, Customer Experience Management capabilities, network infrastructure assets, and the Bon Espoir Tier IV Data Centre. However, these capabilities currently operate within a fragmented enterprise landscape characterised by disconnected data sources, manual and email-based workflows, siloed processes, limited operational visibility, and complex cross-functional dependencies.

We recognise the six systemic failures identified across the discovery programme as the primary barriers to transformation success:

- Data fragmentation and absence of a trusted enterprise-wide view.
- Dependence on unstructured data and manual information handling.
- Email functioning as the primary workflow engine.
- Lack of real-time operational visibility and decision support.
- Cross-functional coordination and process bottlenecks.
- Human intervention acting as the integration layer between systems

These challenges are interconnected and require coordinated transformation across people, process, technology, data, governance, and culture rather than isolated technology interventions. Success will depend on establishing the foundational capabilities that enable scalable digitalisation, automation, analytics, and AI across the entire enterprise.

We also understand that the future strategy must coexist with and guide several critical transformation initiatives already underway, including the D365 Finance & Operations programme, LATRO revenue assurance initiatives, Track 1 Quick Wins, and the broader 11-item Platform Spine that underpins CWS's long-term transformation ambitions. The strategy must provide a unified transformation framework that aligns these programmes, manages interdependencies, and sequences investments according to business value, organisational readiness, and platform maturity.

Capgemini fully endorses CWS's strategic transformation principle:

"Data before AI. Workflow before Automation. Integration before Scale."
This principle will guide every recommendation within our strategy. We will prioritise trusted data foundations, enterprise integration, workflow modernisation, governance, and capability building before scaling automation, advanced analytics, and AI-driven use cases. This approach ensures that transformation outcomes are sustainable, scalable, and aligned with CWS's operational realities.

Our understanding is that the success of the transformation will depend on five strategic imperatives:

1. Establish trusted enterprise data, governance, and analytics foundations.
2. Replace manual and email-driven processes with integrated digital workflows.
3. Implement an enterprise integration architecture connecting business and operational systems.
4. Align transformation investments against the Platform Spine and existing programmes.
5. Embed governance, workforce enablement, change management, and responsible AI practices as foundational enablers.

The expected outcome of this engagement is a practical and actionable 3-year Digitalization and AI Strategy that provides CWS with a target operating model, future-state architecture, prioritised transformation portfolio, enterprise governance framework, workforce and capability roadmap, business cases, value-realisation measures, and a phased implementation plan. The strategy will provide CWS with a clear pathway to accelerate digital transformation, strengthen competitiveness, improve customer and employee experiences, unlock new growth opportunities, and establish itself as Seychelles' leading data-driven and AI-enabled Digital Service Provider.

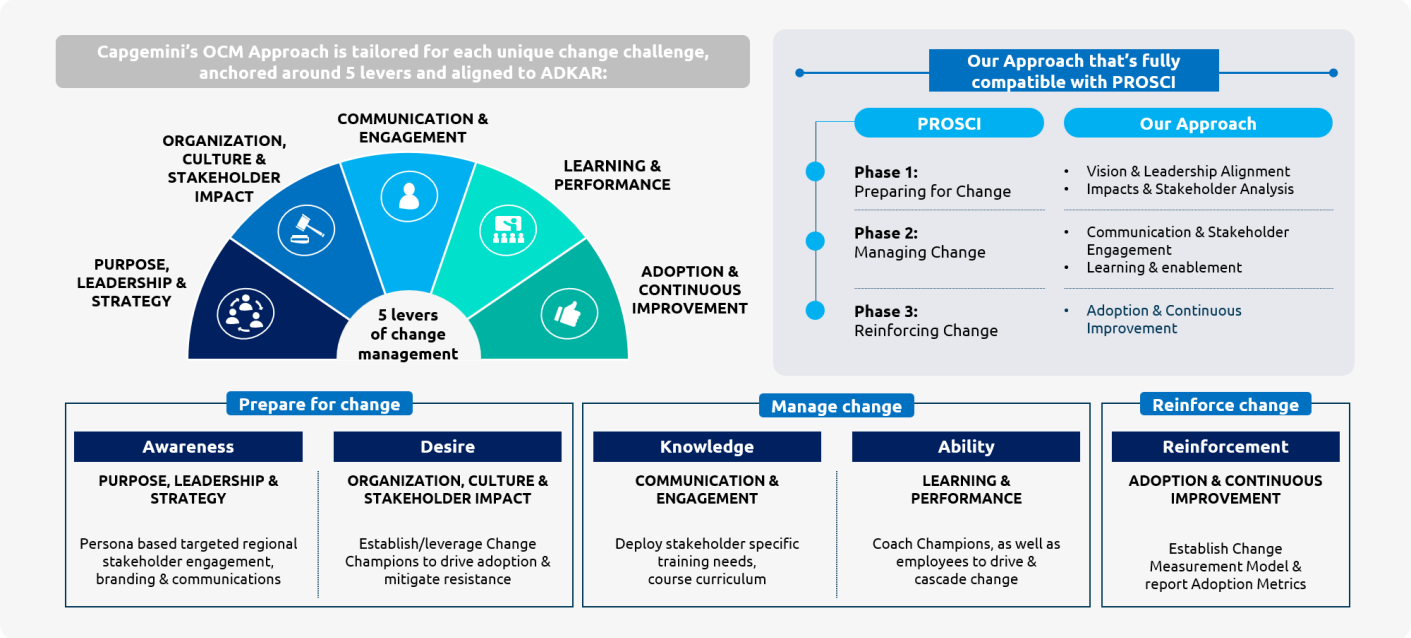

3. Proposed Methodology

A. Domain 1- Organizational, Structure, Culture and Change Management

1. Our Approach — Five Levers of Change Management, Anchored to ADKAR

Technology transformation succeeds only when organization embrace new ways of working. CWS's discovery findings make this the defining priority of the three-year journey to become a Digital Service Provider (DSP): - the function is digitally supported but not structurally digitalized, manual workloads remain high, middle-layer coordination friction persists across departments, and there is currently no formal enterprise change management programme.

To support CWS's specific transformation needs, we recommend leveraging Capgemini's proven OCM approach, that can be customized to its unique challenges and anchored in the five levers of the ADKAR framework.

The levers are deployed across three phases — **Prepare, Manage and Reinforce Change** within the 16-to-20-week strategy engagement, and then carried forward by CWS across the three-year transformation programme.

The five levers define what must be worked on; the three phases define when; and ADKAR defines the individual journey each CWS employee completes. Together, they take CWS from its current culture baselined and understood in **Prepare** — to the desired behaviours of a Digital Service Provider, built through a led and supported change journey in **Manage**, and embedded as sustainable adoption in **Reinforce**.

To operate these five levers, we will design an Enterprise Change Management (ECM) Programme — the change capability CWS will own and operate to sustain its Digital & AI transformation. The ECM Programme will run all five levers across the full portfolio — Track 1 quick wins, Track 2 structural investments, and the parallel D365 F&O implementation — through one governance model, one change network and one communication architecture. Capgemini designs and mobilises the programme within the 16–20 week engagement; CWS owns and operates it thereafter. Detail follows below.

2. Prepare for Change

Lever 1 – Purpose, Leadership & Strategy (ADKAR: Awareness)

Objective: Create organization-wide awareness of why CWS must transform into a Digital Service Provider, with leaders visibly championing and reinforcing the change narrative.

Key Activities

- **Change vision and case for change** -the DSP transformation narrative, articulated in CWS's context: outlining the strategic rationale for change, the drivers of urgency, and the implications for each part of the organization.
- **CXOs alignment sessions** conducted at engagement start and at each strategy gate, producing a change leadership charter that defines and reinforces visible sponsorship behaviours.
- **N-1/N-2 leadership cascade** -working sessions providing managers early sight of direction along with the tools and guidance to effectively lead their teams through change.
- **Change governance design** - clear decision rights, alignment with overarching programme governance, and an integrated portfolio-level change calendar to coordinate activities across all workstreams.
- **Monthly leadership alignment cadence** established and run by Capgemini through the 16–20-week engagement, with the rhythm and toolkit handed over for CWS to continue.

Lever 2 – Organization, Culture & Stakeholder Impact (ADKAR: Desire)

Objective: Evaluate CWS's current state across mindset, behavioural adoption, and change capacity, and build the commitment to the transformation by addressing sources of resistance at their root.

Key Activities

- **Digital culture maturity diagnostic** — A six-dimensional maturity assessment covering Leadership & Direction, Data & Decision-Making, Ways of Working, Change Capacity, Digital & AI Fluency, and Collaboration & Trust, evaluated using a five-level scale through a culture survey, targeted interviews and review of existing discovery outputs.
- **Change readiness assessment** — A structured Likert-scale survey, segmented by department, employee level and length of service.
- **Resistance mapping and stakeholder impact analysis** — Assessment of resistance by root cause, form, influence and a named conversion strategy for each stakeholder segment, with the middle layer as focal point.
- **Change Champion network design** — Change champions across all departments to drive adoption, gather feedback, and mitigate resistance, with N-1 leaders acting as change leads and senior sponsors providing active sponsorship.

3. Manage Change

Lever 3 – Communication & Engagement (ADKAR: Knowledge)

Objective: Build stakeholder awareness by clearly communicating the nature of change, its strategic importance, and what it means for each audience group.

Key Activities:

- **Unified narrative, manager-led cascade**- a single, cohesive transformation narrative delivered through line managers, giving the middle layer to play an active and visible leadership role in driving adoption.
- **Persona-based stakeholder journeys**- distinct communication tracks for CXOs, middle management, frontline teams and support functions, tailored to their specific needs and transformation roles.
- **Rolling 30–60–90-day communication plan** synchronized with programme milestones, featuring pulse checks, Q&A forums and regular feedback sessions to drive transparency and engagement.
- **Learning needs capture** through engagement channels, feeding directly into the design and prioritization of Lever 4 training solutions.
- **Evidence-led messaging**- early communications centred on Track 1 quick-wins, building credibility and momentum before embarking on the longer-term structural transformation.

Lever 4 – Learning & Performance (ADKAR: Ability)

Objective: Strengthen the ability to work differently by coaching Change Champions to lead change locally while enabling employees to drive and cascade change.

Key Activities:

- **Digital ways-of-working framework** (**Concrete from → to behaviour shifts)**: work moves from email and Excel into workflow-managed processes; decisions move from manual extracts to trusted shared data; silos give way to clear handoff standards; AI becomes a core capability; improvement becomes routine. The framework will be developed collaboratively with CWS teams to build genuine ownership across the organization.
- **Training needs assessment and curriculum design** — stakeholder-specific curriculum spanning digital and AI fluency, future-state process execution and data-driven decision-making.
- **Change leadership development** — coaching and enablement for people managers and Change Champions to strengthen their ability to lead and cascade change in their departments.
- **Train-the-trainer model** that embeds expertise internally and enables capability to scale organically across the organization.

4. Reinforce Change

Lever 5 – Adoption & Continuous Improvement (ADKAR: Reinforcement)

Objective: Sustain and embed the change throughout go-live and beyond the engagement through structured measurement, reinforcement and a culture of continuous improvement.

Key Activities:

- **Change Measurement Model**- A comprehensive set of adoption KPIs combining leading indicators (participation, usage, proficiency) and lagging indicators (manual-workload reduction, cycle time, data-driven decision rate), reviewed as part of existing management routines.
- **Pulse-survey cadence** tracking movement against the culture and readiness baselines.
- **Reinforcement design**- recognition programs, integration of new behaviours into performance objectives, and a structured phase-out of legacy tools, processes and reports to reinforce sustainable adoption.
- **Continuous improvement loop**- experiment–measure–scale routines owned by the Change Champion network to identify, validate, and expand successful practices across the organization.
- **Capability handover** - trained change network, documented methodology and toolkit, operating rhythm, and a 12-month change roadmap transitioned to and owned by CWS.

As introduced in our approach, the ECM Programme is the driving engine behind the five levers giving CWS a formal enterprise level change capability for the first time, designed as part of Track 2.

5. Programme Structure

The ECM Programme design that operates through a three-tier change organization, embedded within CWS's existing programme governance:

Tier	Composition	Role	Cadence
Change Steering	CXOs Change Sponsor and sponsor group	Sets direction, approves the change calendar, resolves cross-functional barriers, models sponsorship behaviours	Monthly
Change Management Office (CMO)	CWS Change Lead with a small core team	Owns the change methodology, portfolio change calendar, communication architecture and Change Measurement Model; coordinates change activity across Track 1, Track 2 and D365 F&O	Weekly operations; fortnightly review
Change Network	N-1 change leads per function; Change Champions in every department (part-time roles)	Translates change into local context, delivers manager-led communication, surfaces resistance early, drives adoption on the ground	Monthly Champion forums; continuous in-team activity

Our deliverable is the complete ECM Programme Design — a fully documented design pack covering the governance structure, roles and responsibilities, ways of working, methodology and toolkit, measurement model, mobilization roadmap and indicative resourcing as described above providing CWS with everything needed to stand up, staff and operate as its own capability.

6. Alignment with Expected Outputs

RFP Expected Output	Delivered Through	Phase / ADKAR
Digital culture maturity diagnostic	Lever 2 – Culture Maturity Diagnostic (heatmap, enablers and risks)	Prepare/Desire
Change readiness assessment and resistance mapping	Lever 2 – Readiness Assessment & Heatmap; Resistance Map & Stakeholder Strategy	Prepare/Desire
Design of an Enterprise Change Management Programme (Track 2)	Section 5 – ECM Programme Design (structure, components, mobilization roadmap)	All phases
Communication / engagement strategy	Lever 3 – Communication & Engagement Strategy and 30–60–90 calendar	Manage/Knowledge
Digital ways-of-working framework	Lever 4 – Ways-of-Working Framework	Manage/Ability

Each deliverable below is scoped to CWS's Digital & AI transformation journey and delivered as a concise, decision-ready artefact (typically a 3–4 slide summary plus a supporting one-page framework), designed for direct use rather than as a stand-alone organisational or HR transformation programme.

Key Deliverables:

- **Leadership Sponsorship & Alignment Framework**– Assessment of leadership alignment and recommendations to strengthen executive sponsorship for the Digital & AI transformation journey. Deliverable will include an executive sponsorship model, leadership engagement principles, governance touchpoints, and recommended sponsorship actions required to support the transformation.
- **Output Format**
  - Executive presentation deck
  - Up to 3 slides/pages
  - Includes leadership alignment assessment, sponsorship model, and recommendations
- **Scope Boundaries**
  - Includes high-level leadership sponsorship recommendations and governance considerations.
  - Excludes executive coaching, leadership performance assessments, individual development plans, leadership training programs, and execution support for sponsorship activities
- **Change Impact & Organizational Readiness Assessment**– Analysis of the people, process, and technology impacts of prioritized transformation initiatives, together with organizational readiness findings, key adoption risks, resistance themes, and recommended mitigation actions.
- **Output Format**
  - Executive assessment report
  - Up to 5 slides/pages
  - Includes readiness summary, impact assessment, risk areas, and recommendations
- **Scope Boundaries**
  - Assessment based on stakeholder consultations, existing discovery outputs, and representative business inputs.
  - Provides an enterprise-level view of readiness and impacts.
  - Excludes department-level detailed assessments, enterprise-wide employee surveys, role-by-role impact analysis, workforce restructuring recommendations, and implementation of change interventions.

- **Change Champion Network Strategy**– Recommended approach, governance structure, operating model, and roadmap for establishing a Change Champion Network to support future transformation activities and adoption objectives.
- **Output Format**
  - Executive presentation deck
  - Upto 3 slides/pages
  - Includes governance model, operating principles, and indicative rollout roadmap
- **Scope Boundaries**
  - Includes recommended structure, roles, responsibilities, and engagement mechanisms.
  - Excludes identification of individual champions, training delivery, network mobilization, resource augmentation, and ongoing management of the Change Champion community.
- **Communication & Stakeholder Engagement Strategy and Roadmap**–. Strategic communication and stakeholder engagement framework outlining stakeholder groups, engagement objectives, communication principles, governance mechanisms, and a high-level roadmap aligned to the transformation lifecycle.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes stakeholder segmentation, communication principles, engagement roadmap, and governance recommendations
- **Scope Boundaries**
  - Includes recommended communication approach and stakeholder engagement model.
  - Excludes development of communication collateral, communication campaign execution, branding support, content creation, communication channel management, and ongoing communication operations.
- **Change Management Roadmap**. A high-level transformation adoption roadmap outlining priority change management initiatives, governance requirements, capability-building recommendations, adoption milestones, and success measures required to support the Digital & AI transformation journey.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes roadmap, adoption milestones, governance recommendations, and KPI considerations
- **Scope Boundaries**
  - Includes strategic sequencing and implementation guidance across the transformation horizon.
  - Excludes detailed project plans, training curriculum development, training delivery, change office staffing, adoption execution support, and ongoing benefits realization management.

Domain 1 Deliverable Boundaries

- All Domain 1 deliverables are advisory and strategy-oriented in nature and will be delivered as executive-level presentation artefacts. Deliverables are intended to define frameworks, recommendations, governance constructs, assessments, and roadmaps required to support future implementation by CWS.
- Unless explicitly stated, individual deliverables will be limited to 3-5 slides/pages per output, and the scope excludes implementation, execution support, detailed organizational redesign, training delivery, communication campaign execution, employee survey administration, and ongoing change management operations.

Area	Impact Category:	key questions
People	Role and/or Responsibility	▪ Does the change affect an existing role or a new role? ▪ Will there be an increase/decrease in current tasks? ▪ Will there be a change frequency of work?
	Organization Structure	▪ Will there be a shift in managerial oversight or governance? ▪ Will there be an increase/decrease in workload?
	Skills / Competencies	▪ What changes to current skill sets will be required? ▪ What new skills / behaviors are required to support the new process / ways of working? ▪ Will new performance metrics be implemented?
Process	Policies / Business Rules	▪ What new policies / guidelines / rules are required?
	Workflow / Handoffs	▪ What visibility or access to information will be added, removed or changed? ▪ What are the changes to data sources or input? ▪ What are the changes to reports or outputs? ▪ What changes will occur to customer / supplier interaction? ▪ What manual tasks will be automated through workflow?
Technology	Information	▪ Has the method for accessing or obtaining information changed? If yes, describe. ▪ Is there access to new information?
	Tools	▪ What new/changed equipment, tools, computing requirements are needed to be put in place?
	Systems	▪ Are there changes to existing system interfaces? If yes, describe. ▪ What systems are being retired?

Impact Level	Key Characteristics
High (H)	▪ Impacts a large group of end users ▪ Substantial changes to workload or responsibilities ▪ Impacts multiple business processes that require interaction across business groups ▪ Users must learn new systems, interfaces, or technology and process skills
Medium (M)	▪ Impacts a smaller number of end users ▪ Modest changes to workload ▪ Impacts only to processes that are contained within a single internal organization ▪ Minimal system/interface training is required
Low (L)	▪ Impacts a minimal number of end users ▪ Group or individuals may need to operate slightly differently in the future but minimal changes to skill sets, workload or process

Illustrative: Change Impact & Organizational Readiness Assessment

For every stakeholder group, specific communication and engagement measures ensure the Change Story to be transported

Measure	Details	External Stakeholders				Internal Stakeholders		
		Clients	Investors	Public	Leadership	Change Driver	Mgmt.	Employees
Townhall	Host virtual meetings to share updates and enable Q&A sessions				✓	✓	✓	✓
Intranet Page	Establish a central hub for regular updates and detailed resources				✓	✓	✓	✓
Newsletter	Publish updates regularly to keep employees and clients informed	✓				✓	✓	✓
MS Teams Post	Share brief success stories to capture attention and spark dialogue					✓	✓	✓
Video Messages	Use leadership videos to communicate vision and demonstrate commitment					✓		✓
Lunch & Learn / virtual sessions	Create informal spaces for open dialogue and feedback	✓					✓	✓
Leadership information set & speaking notes	Deliver a unified message through a comprehensive information pack				✓	✓	✓	
MS Teams Community	Build a community platform for change-related resources and collaboration				✓	✓		
Pulse Checks	Monitor employee sentiment with short, periodic surveys							✓
Roadshows & information package	Present a consistent message to engage clients and investors with info packs	✓	✓					
Website / Press Release	Share relevant change-related information with external partners	✓	✓	✓				

Illustrative: Communication & Stakeholder Engagement Strategy and Roadmap

Domain 1 - Phased Delivery Roadmap

AI Strategy and Governance delivery across the 16 to 20 week engagement, with milestones, workshops, and phase gates

Weeks 1-4	Weeks 5-12	Weeks 13-17	Weeks 18-20
01 Diagnostic & Validation *Weeks 1 to 4*	**02 Strategy Design** *Weeks 5 to 12*	**03 Roadmap & Operating Model** *Weeks 13 to 17*	**04 Handover** *Weeks 18 to 20*
OBJECTIVE Assess organizational readiness, culture, stakeholder impacts, leadership alignment, and change maturity	**OBJECTIVE** Design the Enterprise Change Management framework and adoption strategy required to support CWS's Digital and AI Strategy	**OBJECTIVE** Define change operating structures, adoption measures, governance mechanisms, and capability enablement requirements.	**OBJECTIVE** Validate recommendations, ,roadmap, and transition enterprise change management assets to CWS.
KEY ACTIVITIES • Discovery review and stakeholder interviews • Digital culture maturity assessment • Change readiness assessment • Stakeholder impact and resistance analysis • Leadership alignment workshops	**KEY ACTIVITIES** • Enterprise Change Management Programme design • Change Champion Network design • Communication & Engagement Strategy development • Change governance and sponsorship framework	**KEY ACTIVITIES** • Change Management Office (CMO) design • Adoption measurement framework • Change KPI definition • Capability-building recommendations • Continuous improvement framework	**KEY ACTIVITIES** • Executive review sessions • Knowledge transfer workshops
DELIVERABLES • Change Readiness Assessment • Digital Culture Maturity Assessment • Stakeholder Impact Analysis • Resistance & Risk Heatmap	**DELIVERABLES** • Enterprise Change Management Framework • Leadership Sponsorship Framework • Change Champion Network Strategy • Communication & Engagement Strategy	**DELIVERABLES** • Change Management Roadmap • Communication & Engagement Roadmap • Adoption KPIs & Dashboard	**DELIVERABLES** • Executive Change Management Pack

B. Domain 2 - Senior Leadership Engagement and Governance

Leadership-Led Digital & AI Program Governance Framework

Our Approach — Four Pillars of Leadership-Led Transformation

Digital and AI transformation initiatives often fail not because of technology limitations, but due to unclear ownership, fragmented decision-making, insufficient leadership sponsorship, and inconsistent adoption across the organization.

To realize sustainable business value from Digital and AI investments, the organization requires an enterprise-level governance model that provides strategic direction, decision-making discipline, accountability, capability development, and adoption oversight.

Our approach is to establish a **Leadership-Led Digital & AI Program Governance framework** that enables executive leaders to actively steer the transformation while empowering managers and employees to adopt and embed new ways of working. This framework creates a clear line of sight from strategic objectives to operational execution, ensuring that transformation initiatives remain aligned to business priorities and deliver measurable outcomes.

The governance framework is built on four interconnected pillars that collectively establish the leadership, governance, capability, and adoption mechanisms required to sustain transformation at scale.

	PILLAR	FOCUS	CONTRIBUTION TO THE TRANSFORMATION
01	**PILLAR 1 – LEADERSHIP ALIGNMENT & SPONSORSHIP** A united, visible leadership team with defined sponsorship roles	▪ Vision and strategic alignment ▪ Sponsorship framework ▪ Leadership accountability ▪ Execution governance	Converts established direction into active, disciplined sponsorship and success measures
02	**PILLAR 2 – GOVERNANCE & TRANSFORMATION CONTROL** Digital governance framework, Transformation Programme Board, decision and escalation models	▪ Governance framework & forums ▪ Decision-making & escalation models ▪ Performance & value tracking ▪ Investment & risk oversight	Provides governance authority, accountability, transparency and value control
03	**PILLAR 3 – EXECUTIVE DIGITAL & AI LITERACY AND LEADERSHIP** CAPABILITY AI-literate, digitally capable leaders at CXOs and N-1	▪ Leadership capability assessment ▪ Executive literacy program design ▪ Leadership development roadmap ▪ Capability progression & roadmap refinement	Builds the shared literacy and leadership capability to direct an AI-enabled business
04	**PILLAR 4 – CHAMPION-LED ADOPTION & CHANGE** A distributed network that drives adoption on the ground	▪ Digital & AI champion network design ▪ Role-based adoption & peer learning ▪ Champion communities & success stories ▪ Feedback mechanisms with leadership	Converts leadership direction into daily behaviour and feeds insight back to leadership

Together, these four pillars create the leadership, governance, capability and adoption foundation needed to achieve a sustainable and high-impact Digital & AI transformation.

2. The Four Pillars

Pillar 1 – Leadership Alignment & Sponsorship

Digital and AI transformation must be visibly sponsored from the top of the organization. Leaders play a critical role in setting direction, demonstrating commitment, and reinforcing transformation priorities. This pillar will create a unified leadership coalition that provides strategic direction, sponsorship, and accountability across the transformation journey

Pillar 2 – Governance & Transformation Control

As transformation initiatives expand across functions, strong governance becomes essential to coordinate decisions, manage dependencies, oversee investments, and mitigate risks. This will provide the governance authority, transparency, accountability, and control mechanisms required to manage transformation consistently across the enterprise.

Pillar 3 – Executive Digital & AI Literacy and Leadership Capability

Effective governance requires leaders who understand both the opportunities and implications of Digital and AI technologies. Leadership capability is therefore a critical enabler of successful transformation. It will help build the leadership capability required to make informed decisions, govern AI-enabled initiatives, and drive transformation outcomes with confidence.

Pillar 4 – Champion-Led Adoption & Change

While leadership provides direction, transformation succeeds only when change is adopted throughout the organization. A structured champion network creates a bridge between leadership intent and employee adoption. This governance pillar also serves as the Change Steering mechanism for the Enterprise Change & Transformation programme, ensuring alignment between transformation governance and change management activities covered in Domain1. The Champion Network and Adoption Framework will operate in conjunction with the Enterprise Change Management (ECM) Programme defined in Domain 1.

The four pillars operate as an integrated governance ecosystem. Together, these pillars create an enterprise-wide governance framework that ensures Digital & AI transformation is not managed as a series of disconnected initiatives, but as a coordinated, leadership-driven program with clear accountability, measurable outcomes, and sustainable adoption across the organization.

3. Enterprise-Wide Governance Structure

To operationalize the governance framework, we recommend a **three-tier governance structure** that provides clear accountability, decision-making authority, and escalation pathways across the transformation lifecycle.

Tier	Composition	Mandate	Cadence
Transformation Programme Board	CEO / CXOs sponsors	Strategic direction, investment and risk oversight, cross-functional barrier resolution, benefits accountability	Monthly
Transformation Council	Transformation lead, workstream owners - HR, IT, Finance	Portfolio coordination across workstreams, decisions within delegated rights, dependency and change-calendar management, dashboard review	Fortnightly
Workstream & Adoption Forums	Workstream leads, Champion Network representatives, functional managers	Delivery-level decisions, adoption tracking, escalation of risks and resistance, feedback into the Council	Weekly / as scheduled

Supported by a **Governance Charter**, **Delegated Authority Matrix**, and **Decision & Escalation model**, this structure ensures transformation governance and change governance operate as a single, integrated governance framework.

- **Delegated-authority matrix** — for each decision type (scope, investment, design, risk acceptance, exceptions), the tier that decides, who is consulted, and the target turnaround time.
- **Escalation thresholds and paths** — defined triggers (value, risk, cross-functional impact, schedule) that move a decision up a tier, with a single documented route from forum to Council to Programme Board.
- **Governance charter** — the framework, decision rights and escalation model documented in one charter, so every decision has a defined owner, forum and turnaround expectation.

4. Measuring Success

We recommend a performance measurement framework for each pillar, combining:

- **Leading indicators** to track adoption, engagement, governance effectiveness, and capability development.
- **Lagging indicators** measure business outcomes, value realization, transformation progress, and sustained behavioral change.

Together, these metrics provide visibility into both transformation execution and long-term impact.

Pillar	Leading Indicators (Suggestive)	Lagging Indicators (suggestive)
P1 – Leadership Alignment & Sponsorship	Executive participation in governance forums; sponsorship actions completed; governance adherence; decision turnaround time	Sustained sponsorship; faster decision-making; improved strategic alignment
P2 – Governance & Transformation Control	Governance forums conducted as planned; dashboard and reporting adherence; escalations resolved within target	Achievement of transformation milestones; benefits realization against baseline; execution discipline embedded
P3 – Executive Literacy & Leadership Capability	Capability assessments completed; literacy programme participation and completion; development roadmap actions on track	Measured leadership capability uplift; improved literacy scores; leaders visibly directing AI-enabled decisions
P4 – Champion-Led Adoption & Change	Champions activated; adoption campaigns executed; community participation; use-case engagement	Increased active users; improved adoption rates; stronger employee engagement and behavioural change

Governance capabilities should evolve progressively across the transformation journey, moving from governance establishment and decision-rights clarity (Year 1) to portfolio management and benefits tracking (Year 2), and finally to enterprise-wide value realization, AI governance maturity and continuous improvement (Year 3). We design this maturity path and activate Year 1 within the 16–20-week engagement; CWS's Transformation Programme Board leads Years 2–3 using the framework and toolkit we hand over.

5. Alignment with Expected Outputs

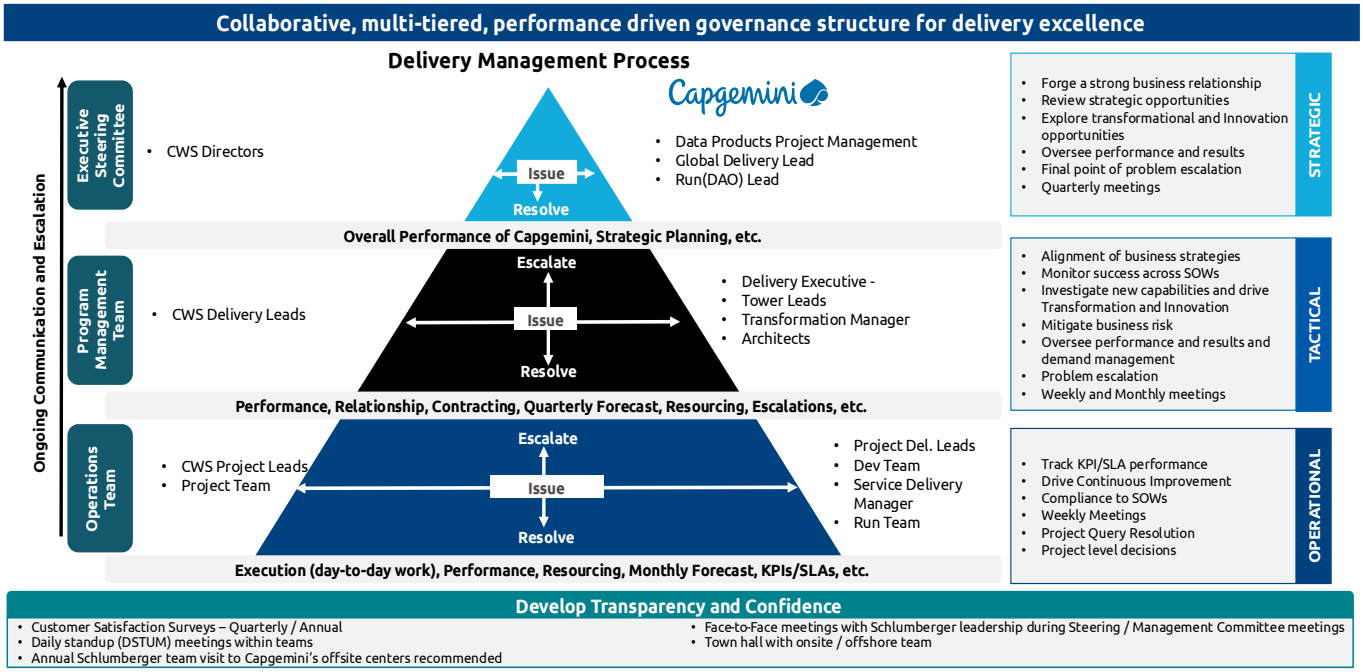

RFP Expected Output	Delivered Through	Pillar
Executive digital and AI literacy programme design	Section 2 (Pillar 3) – literacy baseline and structured programme design; delivered from Domain 3	Pillar 3
Digital governance framework (including a Transformation Programme Board structure)	Section 4 – three-tier framework anchored by the Transformation Programme Board	Pillar 2
Decision-making / escalation models	Section 4 – delegated-authority matrix, escalation thresholds and governance charter	Pillar 2
Leadership capability assessment with a development roadmap	Section 2 (Pillar 3) – CXOs and N-1 capability assessment and sequenced development roadmap	Pillar 3
Governance roadmap and implementation recommendations	Section 6 – Governance Maturity Roadmap, implementation sequencing, governance mobilization activities and operating model recommendations	Pillar 2

Each deliverable is scoped strictly to Digital & AI governance and delivered as a concise, board-ready artefact (a 3–4 slide framework summary plus one-page supporting tools) for direct use by the Transformation Programme Board.

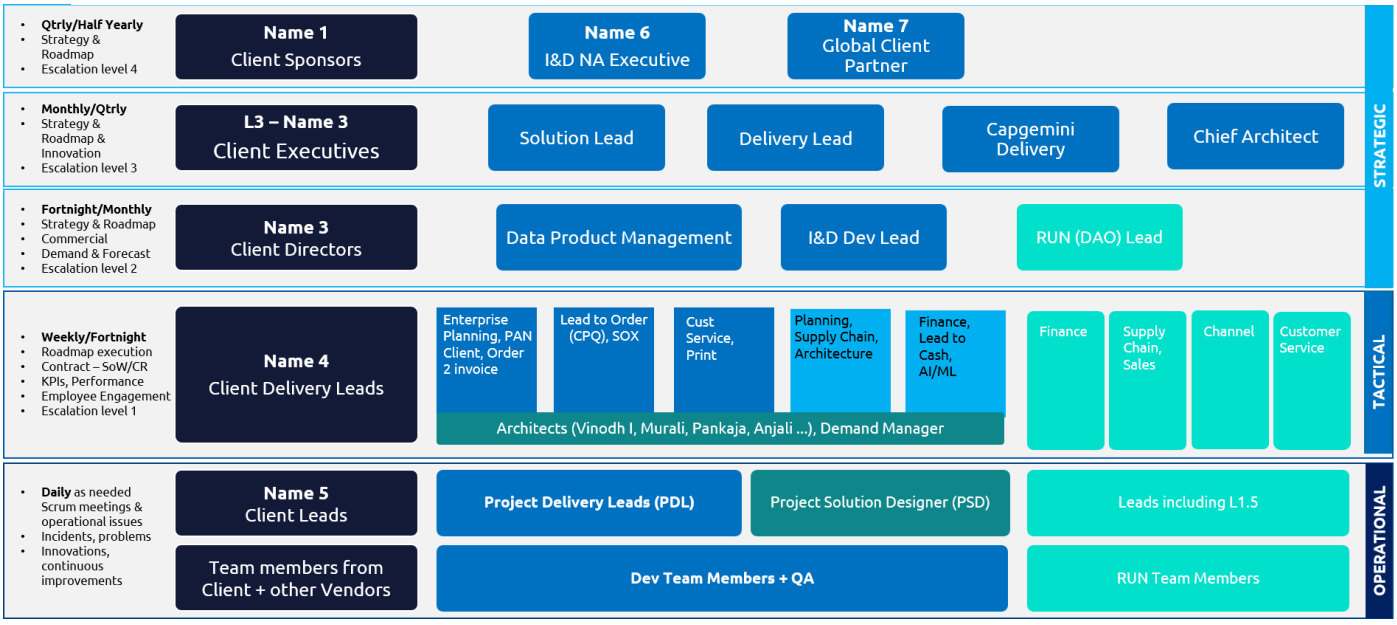

Key Deliverables:

- **Digital & AI Governance Framework & Structure** – Recommended governance framework to support CWS's Digitalization & AI Strategy, including governance principles, roles, accountabilities, decision forums, oversight mechanisms, and operating principles required to govern digital, data, automation, and AI initiatives. The framework will align with CWS's existing management structures and transformation governance requirements, while providing recommendations for responsible AI oversight and cross-functional decision-making.
- **Output Format**
  - Executive presentation deck
  - Up to 5 slides/pages
  - Includes governance principles, governance structure, key roles, governance forums, and AI governance considerations
- **Scope Boundaries**
  - Includes recommended governance structure and operating principles to support Digital & AI transformation.
  - Excludes detailed governance procedures, policy development, committee charters, governance tooling selection, regulatory compliance implementation, AI model approval workflows, and ongoing governance operations.
- **Transformation Programme Board & Forums** – Recommended governance hierarchy outlining Transformation Programme Board structure, governance forums, membership, responsibilities, meeting cadence, and decision-making responsibilities required to oversee the transformation portfolio.
- **Output Format**
  - Executive presentation deck
  - Up to 3 slides/pages
  - Includes governance tiers, forum structure, indicative membership, and governance interactions
- **Scope Boundaries**
  - Includes recommendations for board-level, programme-level, and working-level governance structures.
  - Excludes establishment of governance boards, nomination of members, meeting management, governance secretariat activities, meeting templates, or operational governance support.
- **Decision Rights & Escalation Model** - Recommended decision-making and escalation framework defining accountability, delegated authority principles, governance touchpoints, escalation paths, and decision ownership required to support Digital & AI transformation initiatives.
- **Output Format**
  - Executive presentation deck
  - Up to 3 slides/pages
  - Includes decision categories, governance ownership, escalation hierarchy, and authority principles
- **Scope Boundaries**
  - Includes high-level decision rights and escalation recommendations.
  - Excludes detailed RACI development, business process redesign, approval workflow implementation, authority matrix configuration, and governance process execution
- **Adoption Monitoring & Continuous Improvement Framework**. High-level framework defining recommended Digital & AI adoption measures, governance KPIs, reporting principles, maturity indicators, continuous improvement mechanisms, and executive oversight measures required to monitor transformation progress and value realization.
- **Output Format**
  - Executive presentation deck
  - Up to 4 slides/pages
  - Includes KPI categories, reporting approach, adoption measures, maturity indicators, and improvement model
- **Scope Boundaries**
  - Includes strategic recommendations for monitoring Digital & AI adoption and governance effectiveness.
  - Excludes KPI implementation, dashboard development, reporting tool configuration, data collection processes, benefits realization tracking, and operational reporting activities.
- **Governance Roadmap & Implementation Recommendations** – Phased roadmap outlining the recommended evolution of Digital & AI governance capabilities, governance maturity milestones, implementation priorities, and key activities required to establish and progressively mature transformation governance over the 3-year strategy horizon.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes governance maturity roadmap, capability milestones, implementation sequencing, and strategic recommendations
- **Scope Boundaries**
  - Includes governance capability evolution recommendations and implementation guidance.
  - Excludes governance implementation support, operating model deployment, governance office setup, resource onboarding, governance training delivery, and day-to-day governance management.
- **Domain 2 Deliverable Boundaries**
  - All Domain 2 deliverables are advisory and strategy-oriented in nature and are intended to define the governance mechanisms required to support CWS's Digitalization & AI transformation journey. Deliverables will focus on governance structures, decision-making principles, oversight mechanisms, adoption monitoring, and AI governance recommendations aligned to CWS's transformation objectives.

- Unless explicitly stated, individual deliverables will be limited to 3-5 slides/pages per output and will be delivered as executive-level presentation artefacts. The scope excludes governance implementation, operational governance support, committee operations, policy authoring, governance tool selection, dashboard development, AI governance execution, compliance certification activities, and ongoing governance management.

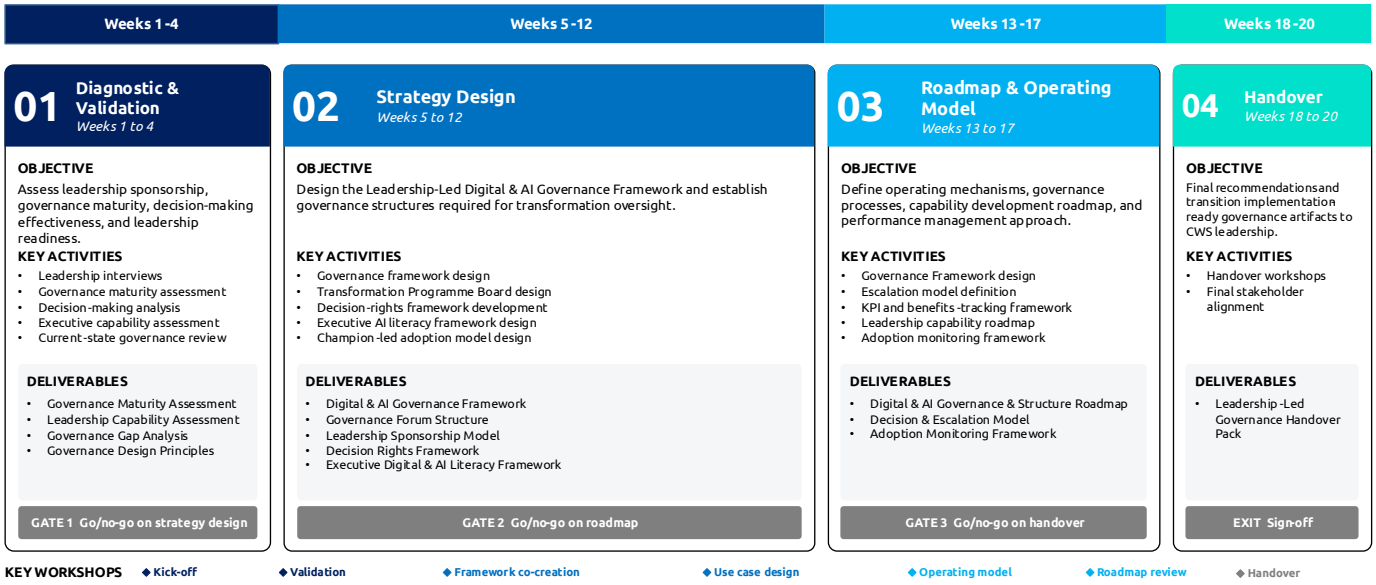

Illustrative: Digital & AI Governance Framework

Illustrative: Digital & AI Governance Structure

Domain 2 - Phased Delivery Roadmap

AI Strategy and Governance delivery across the 16 to 20 week engagement, with milestones, workshops, and phase gates

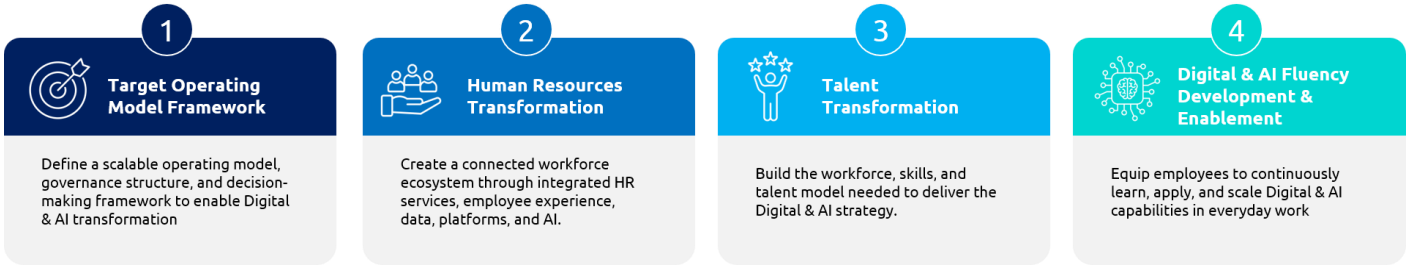

C. Domain 3 - Workforce Transformation and Upskilling

Our Approach:

The transition to a Digital service provider requires a workforce that is ready to adapt, learn and lead in new ways. A structured approach to workforce transformation and upskilling will ensure employees have the skills, confidence, and support needed to adopt new way of working and sustain change.

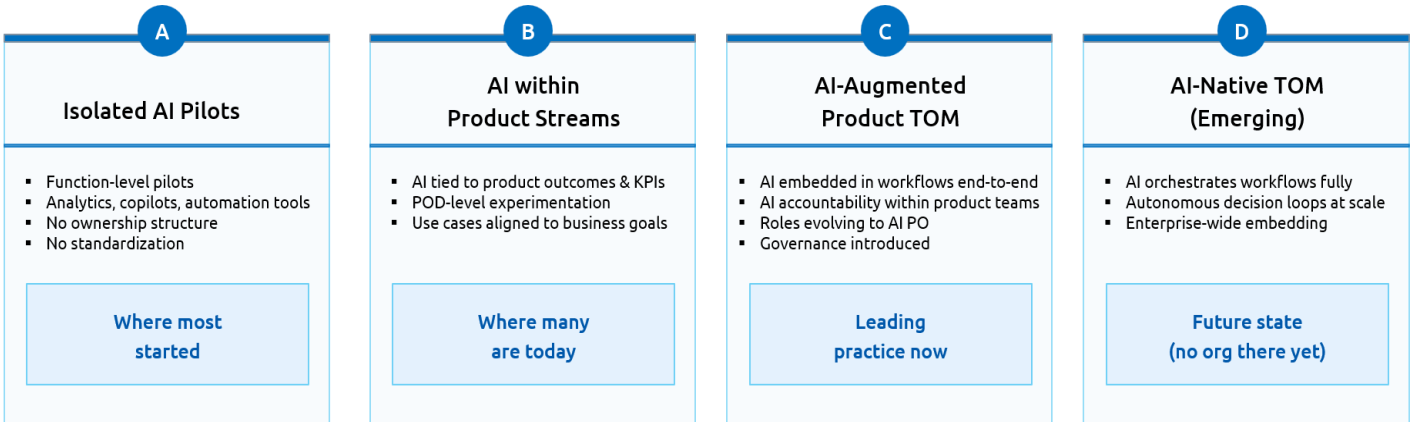

The workforce transformation will be delivered through **four integrated Building Blocks:**

Building Block 1: Target Operating Model Framework for Digital and AI Transformation

Digital and AI transformation is not just about deploying new technologies, it requires evolving operating models, governance, ways of working, and decision-making. Our approach is to develop a Target Operating Model (TOM) Blueprint for the CITO organization, scoped to the roles, governance and decision rights CWS needs to run its Digital & AI transformation, creating a reference framework CWS can extend to adjacent functions on its own initiative. Industry experience shows that organizations typically progress through four stages of AI operating model maturity.

Across industries, 4 stages consistently emerge - most are between B and C

To enable this transition, the Target Operating Model framework focuses on four integrated components:

Component	Objective
Organizational Structure & Governance	Design the future organizational structure, roles, decision-making authorities, and governance required to support Digital and AI transformation and enable effective cross-functional collaboration.
Processes & Ways of Working	Define future-state processes, operating practices, and collaboration models while identifying opportunities to automate.
AI Operating Maturity Model	Assess the current AI maturity level, define the target AI operating model, and establish a roadmap to progress from isolated use cases toward an AI-augmented operating model.
Innovation & AI Enablement	Identify the technology platforms, data foundations, AI capabilities, and innovation enablers required to accelerate business value realization.

Building Block 2: Human Resources Transformation

Our approach is to develop an **Experience-Led HR Transformation Roadmap** that integrates employee experience, HR services, workforce data, digital platforms, and AI capabilities to create a connected workforce ecosystem and support a future-ready, high-performing organization. This roadmap is scoped to the HR capabilities that directly enable CWS's Digital & AI transformation — workforce data, AI-enabled HR services, and digital employee experience for the roles most affected by the transformation — rather than a stand-alone, enterprise-wide HRIS replacement or full HR operating model overhaul.

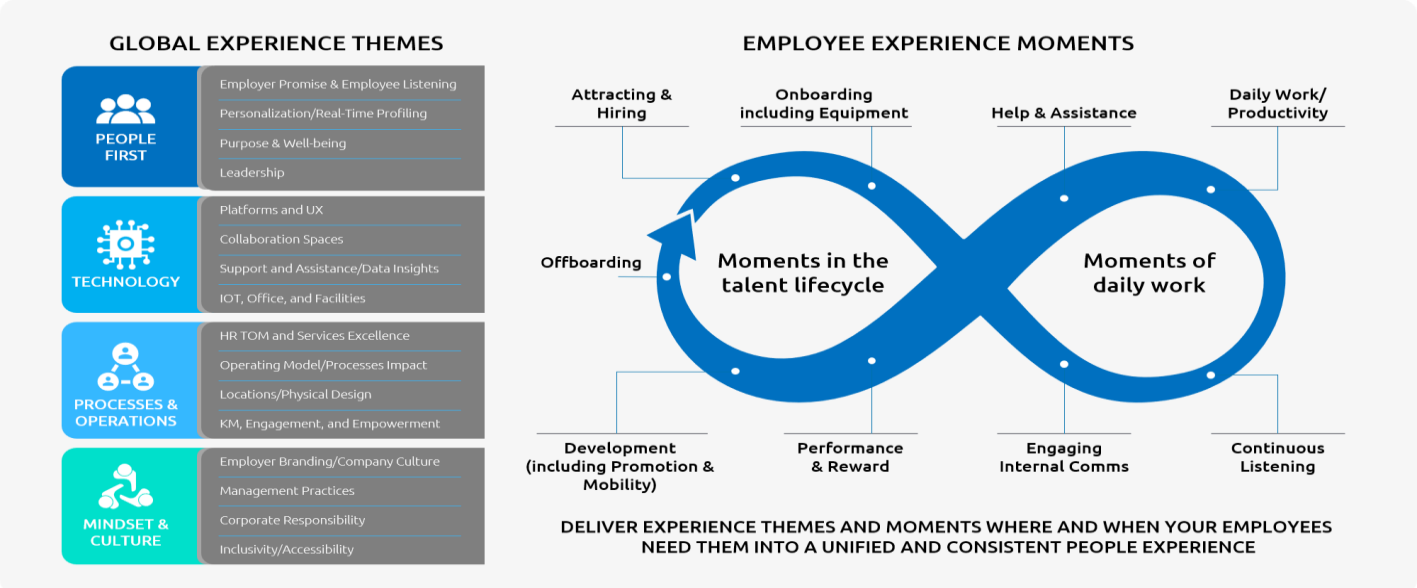

To enable this transition, the HR Transformation framework focuses on three integrated components:

Component	Objective
Experience-Led Workforce Journey	Create a seamless employee experience across the talent lifecycle (attract, hire, onboard, develop, engage, and retain) to improve workforce productivity, employee satisfaction, and adoption of Digital & AI.
HR Systems Integration Strategy	Define the future-state HR technology landscape, integration architecture, and digital employee experience strategy to transform fragmented HR systems and manual processes into an AI-enabled, connected ecosystem. Enable seamless workforce data flow, streamlined end-to-end HR operations, and actionable workforce insights across the employee lifecycle through integrated platforms, automation, and intelligent decision support.
AI-Enabled HR Services Strategy	Define an AI-Enabled HR Services Strategy that transforms fragmented HR processes and disconnected systems into a unified, intelligent HR ecosystem. Identify opportunities to embed AI, automation, and advanced analytics across HR services to enhance employee experience, streamline operations, deliver personalized workforce support, and enable data-driven decision-making at scale.

HR transformation is ultimately realized through the ***moments that matter*** across the employee lifecycle. By redesigning these interactions with a digital- and AI-enabled lens, organizations can transform fragmented employee experiences into connected and scalable workforce journeys.

Moments that Matter:

This is where experience-led HCM ecosystems close the gap—by turning strategy into moments that scale

Building Block 3: Talent Transformation

Technology transformation succeeds when the workforce is equipped to adopt new ways of working, with roles, skills, and talent models evolving alongside Digital and AI capabilities. The Talent Transformation work package ensures the organization has the right workforce, capabilities, and skills to execute its Digital & AI strategy and sustain long-term business outcomes.

To enable this transition, the Talent Transformation framework focuses on three interconnected components:

Component	Objective
Future Role Transition Plans	Define future roles, accountabilities, career pathways, and workforce transition requirements aligned to the Target Operating Model and Digital & AI strategy
Future Workforce Strategy	Determine future workforce demand, workforce composition, sourcing strategy, and resource requirements required to support business transformation.
Future Skills & Capability Roadmap	Identify critical future capabilities, assess current skill gaps, and define the learning and development roadmap required to build Digital, Data, Automation, and AI capabilities.

As Digital & AI transform the way work is performed, organizations must prepare for changing roles, skills, and talent requirements. Our approach addresses this through four focus areas: **role definitions, workforce planning, skills & capability development, and talent acquisition.**

Skills will be mapped to standardized SFIA categories, skill codes, and proficiency levels to establish a structured and scalable capability framework for future workforce planning.

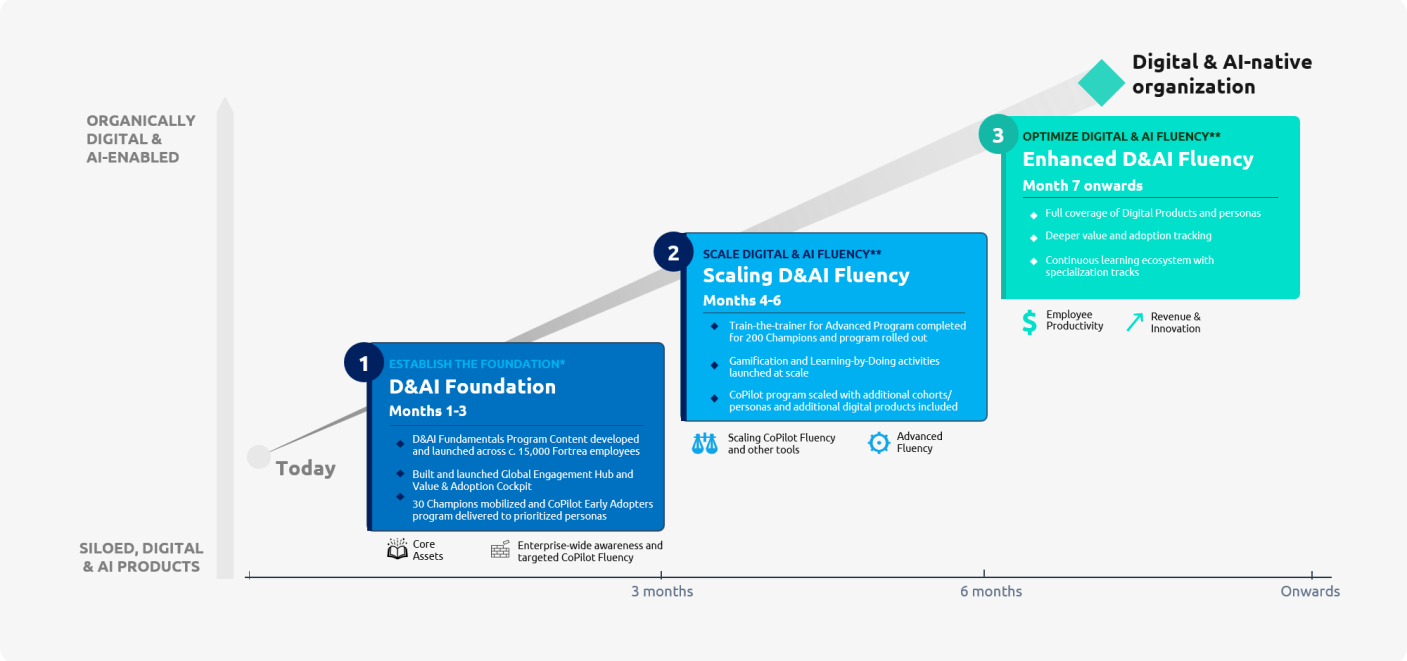

Building Block 4: Digital & AI Fluency Development & Enablement

While Talent Transformation focuses on defining the future workforce, roles, and capabilities, successful transformation requires employees to continuously build and apply those capabilities in their day-to-day work.

To support this objective, the framework focuses on three interconnected components:

Component	Objective
Learning Vision & Strategy	Define the future learning vision, principles, and operating model required to build a continuous learning culture that supports business strategy, Digital transformation, and AI adoption based on the Digital and AI Capability Framework
Digital & AI Fluency Roadmap	Establish a structured roadmap to build Digital, Data, and AI awareness, knowledge, and proficiency across all employee roles for most affected functions
3 Year Upskilling & Reskilling Strategy and Plan	Identify future capability requirements, assess skill gaps, and develop targeted upskilling and reskilling programs to prepare the workforce for Digital and AI adoption

To support the Digital Service Provider vision, we will design a 3-phase **Digital & AI Capability Development Framework** that defines how CWS can build workforce fluency, future skills, and AI readiness at scale.

Central to this approach is the **Digital & AI Fluency Framework**, which provides the structured learning pathways, proficiency levels, and capability-building interventions required to build Digital & AI skills and workforce readiness across CWS.

Each deliverable below is scoped to the workforce and capability shifts required for CWS's Digital & AI transformation and delivered as a concise, decision-ready artefact (typically a 3–4 slide summary plus a one-page framework), not a full enterprise HR or organisational redesign programme.

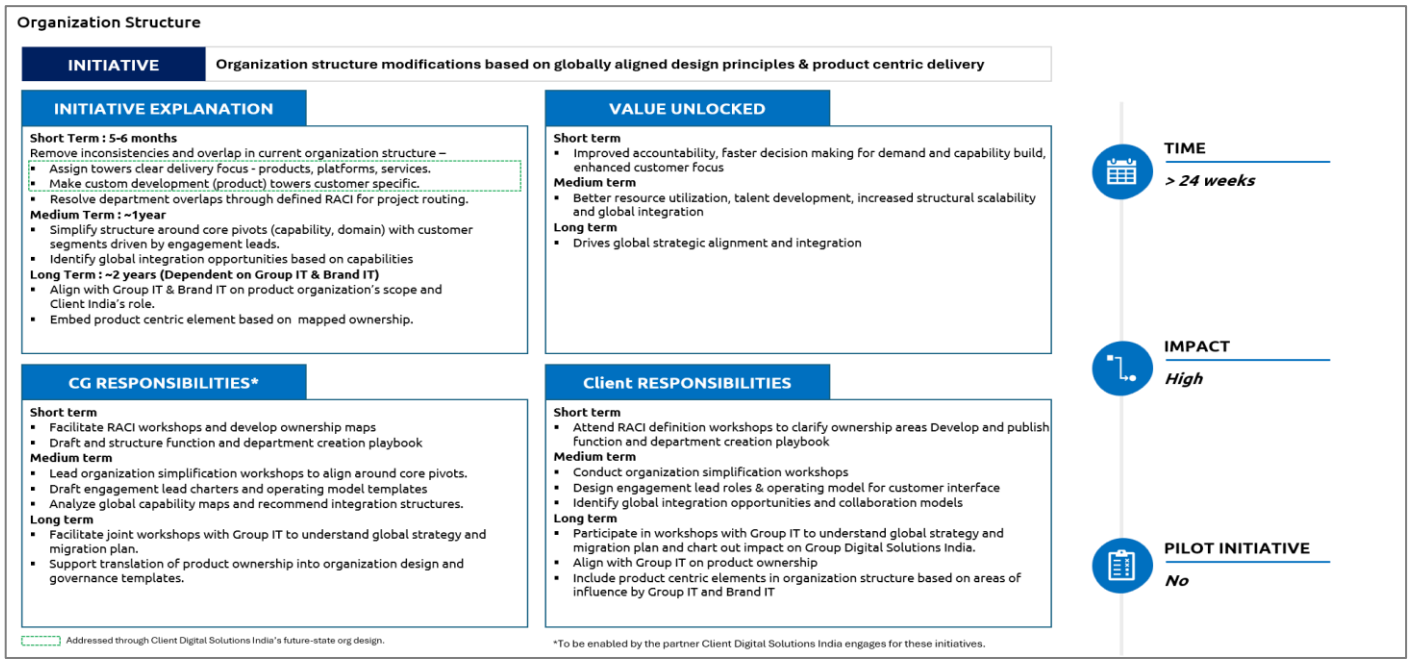

Key Deliverables

- **Target Operating Model (TOM) Framework**– Scalable reference framework and implementation guidance for extending Digital & AI-enabled operating model principles across the enterprise. The framework will define the key organizational capabilities, governance principles, operating model components, and workforce considerations required to support CWS's transition to a Digital Service Provider.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes TOM principles, capability model, governance considerations, and implementation guidance
- **Scope Boundaries**
  - Includes high-level operating model recommendations aligned to Digital & AI transformation objectives.
  - Excludes detailed organizational design, business process redesign, operating procedures, workforce restructuring, role grading, job architecture redesign, and implementation support.
- **Target Operating Model for CITO Organization**: Future-state CITO organizational model outlining recommended structure, operating principles, key roles, responsibilities, and Digital & AI-enabled ways of working required to support the transformation strategy.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes future-state structure, key capabilities, critical roles, and operating principles
- **Scope Boundaries**
  - Includes strategic recommendations for the future-state CITO organization.
  - Excludes detailed organization restructuring, headcount planning, reporting-line design, workforce reorganization, job descriptions, recruitment support, and implementation activities.
- **Workforce Transformation Roadmap** –. Sequenced roadmap outlining workforce, talent, capability, and organizational change initiatives required to support the future operating model and Digital & AI transformation journey over the strategy horizon.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes transformation priorities, milestone-based roadmap, dependencies, and recommended actions
- **Scope Boundaries**
  - Includes strategic workforce transformation recommendations and sequencing.
  - Excludes workforce implementation planning, resource deployment, succession planning, workforce reduction programs, organizational transition management, and execution support
- **Digital & AI Skills Taxonomy and Capability Mapping**- SFIA-aligned framework defining Digital, Data, Automation, and AI capability areas, indicative proficiency levels, future capability requirements, and workforce development priorities required to support the target-state workforce.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes capability architecture, skill clusters, proficiency model, and workforce priorities
- **Scope Boundaries**
  - Includes enterprise-level Digital & AI capability recommendations.
  - Excludes employee skill assessments, individual competency evaluations, certification administration, workforce testing, and detailed workforce inventory analysis.
- **Future Skills & Capability Roadmap** - Prioritized capability-development roadmap identifying critical Digital, Data, Automation, AI, leadership, and business capabilities required to support the 3-year transformation journey.
- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes capability priorities, development phases, and strategic recommendations
- **Scope Boundaries**
  - Includes capability-building recommendations and sequencing guidance.
  - Excludes curriculum development, training content creation, competency assessments, training operations, and capability program execution.
- **3-Year Upskilling & Reskilling Roadmap**. High-level roadmap outlining recommended capability-building interventions, learning priorities, and workforce development initiatives required to support Digital & AI adoption across CWS.

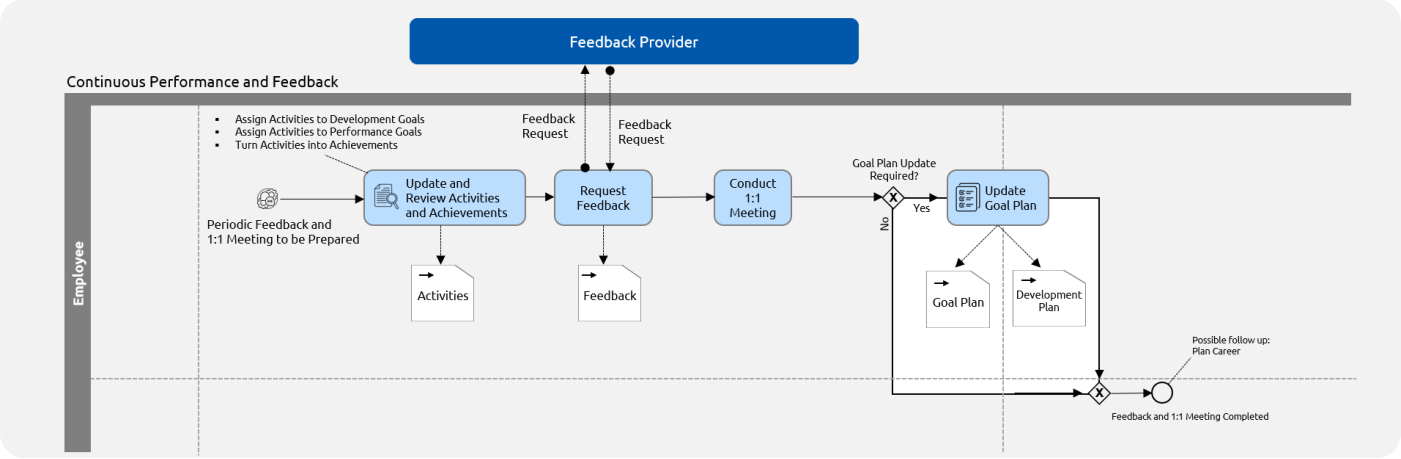

- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes learning themes, workforce segments, capability priorities, and roadmap
- **Scope Boundaries**
  - Includes strategic recommendations for workforce upskilling and reskilling.
  - Excludes training delivery, training-provider selection, certification management, learning management system implementation, and workforce training execution.
- **Role-Based Certification & Learning Pathways**. Recommended learning journeys, certification pathways, and proficiency progression models for key workforce segments impacted by Digital & AI transformation.
- **Output Format**
  - Executive presentation deck
  - Upto **3 slides/pages**
  - Includes indicative learning pathways, certification recommendations, and proficiency progression model
- **Scope Boundaries**
  - Includes recommended certification and learning pathways.
  - Excludes detailed curriculum design, training content development, certification delivery, examination management, accreditation activities, and vendor selection.
- **Future Experience-Led Employee Journey** – Future-state employee experience framework identifying key Digital & AI-enabled interactions, employee journey stages, experience principles, and workforce engagement opportunities across the employee lifecycle.
- **Output Format**
  - Executive presentation deck
  - Upto **4 slides/pages**
  - Includes employee journey map, experience principles, and transformation opportunities
- **Scope Boundaries**
  - Includes strategic employee experience recommendations aligned to Digital & AI transformation.
  - Excludes HR process redesign, employee experience platform implementation, HR technology selection, service design activities, and operational employee experience management.
- **Domain 3 Deliverable Boundaries**
  - All Domain 3 deliverables are advisory and strategy-oriented in nature and are intended to define the workforce, capability, skills, and operating model changes required to support CWS's Digitalization & AI Strategy. Deliverables will focus on future-state frameworks, roadmaps, capability models, workforce recommendations, and implementation guidance.
  - Unless explicitly stated, individual deliverables will be limited to 3-5 slides/pages per output and delivered as executive-level presentation artefacts. The scope excludes organizational restructuring, headcount planning, employee assessments, training delivery, curriculum development, certification administration, HR transformation implementation, workforce transition management, and ongoing workforce operations.

Alignment with Expected Outputs

RFP Expected Output	Delivered Through	Pillar
Enterprise digital and AI skills framework	Digital & AI Skills and Competency Framework aligned to SFIA, including role-based proficiency levels and future capability requirements	BB2 – Skills & Competency Framework
3-year upskilling/reskilling roadmap;	Workforce capability gap assessment, future skills requirements, and a phased Digital & AI learning roadmap aligned to transformation priorities	BB2 – Workforce Planning & Skills Framework + WP3 – Learning Vision & Strategy
Role transition plans for most-affected functions (finance, technical, customer centricity)	Future-state operating model, role architecture, workforce impact assessment, and transition pathways for impacted functions	BB1 – Target Operating Model + BB2 – Workforce Planning Model & Roles Framework
Training curriculum design with partner recommendations	Role-based learning curriculum, capability development pathways, learning ecosystem design, and partner recommendations	BB3 – Training & Enablement
Certification pathway structure	Certification framework mapped to Digital, Data, Automation, and AI competencies with role-based certification pathways	BB2 – Skills & Competency Framework + BB3 – Training & Enablement

Illustrative: Target Operating Model for CITO Organization

To accurately assess whether an employee possesses the right skill sets for their role, it is essential to group related skil ls into clusters, enabling meaningful analysis and interpretation

Original list of skills → **Processing** → **Skills inventory**

Product Management
Project Management
Product Management
Product Owner
Process Management
Coaching
Program Manager
Service Manager
Release Manager
Coaching
Process Management

SFIA

Serves as the framework for the skills and competencies related to:
- Information and communication technologies (ICT)
- Digital transformation
- Software engineering

Capgemini

Defining skills by:
1. Categorizing skills as per the SFIA hierarchy (categories, sub -categories, skill name, code) and with the intended proficiency levels
2. Identifying the skill name and code to support future upgrades

Original Skill Name	SFIA Functional Cluster	SFIA Skill Name
Project Management	Change and transformation	Project Management
Product Management	Development and implementation	Product management
Product Owner	Development and implementation | Change and Transformation	Product management | Requirements definition and management
Process Management	Change and transformation	Business process improvement | Methods and Tools
Coaching	People and skills	Professional development
Program Manager	Change and transformation | Relationships and Engagement	Program Management | Stakeholder Relationship Management
Service Manager	Delivery and operation	Service level management
Release Manager	Delivery and operation	Release management
Coaching	Change and transformation	Business process improvement | Methods and Tools

Illustrative: Digital & AI Skills Taxonomy and Capability Mapping

	IMPACT *What AI now does for each role*	SKILLS GAP *What each person must learn to keep up*	ENABLEMENT NEEDED *What training closes the gap*	SUCCESS MEASURES *How performance will be measured going forward*
Product Owners	▪ AI auto-grooms backlogs, drafts stories & acceptance criteria ▪ Roadmap trade-offs surfaced by AI before build begins ▪ Stakeholder summaries & exec packs generated automatically ▪ **Shift: from writing requirements to defining value, guardrails & AI oversight**	▪ Prompt engineering for fit-for-purpose artefacts ▪ Validating AI outputs ▪ Data fluency: reading KPIs & experimentation results ▪ Governing AI features: bias, compliance & explainability	▪ AI Fluency for POs - GenAI capabilities & banking use cases ▪ Prompt Engineering - reusable libraries for stories, BRDs & OKRs ▪ AI-Assisted Roadmapping - trade-off simulation & delivery risk ▪ Responsible AI for Product - governance, ethics & compliance	▪ Customer value delivered - not stories written ▪ Idea-to-release cycle time & backlog readiness velocity ▪ AI artefact acceptance rate & prompt quality ▪ Prioritisation accuracy & experiment success rate
Business Analysts	▪ BRDs, FRDs, stories & acceptance criteria drafted from transcripts ▪ Process flows (BPMN) generated; inefficiencies flagged by agents ▪ JIRA tickets created & maintained automatically via MCP agents ▪ **Shift: from documenting requirements to structuring intent as AI-ready inputs**	▪ Prompt engineering: translating business intent into precise AI instructions ▪ Critical review of AI artefacts (recognise gaps, ambiguity & hallucinations) ▪ Data literacy: SQL basics, visualisation & model output interpretation ▪ HITL discipline: knowing when to override or escalate AI decisions	▪ GenAI & Agentic Foundations - agents in a delivery context ▪ Prompt Engineering for BAs - BRDs, FRDs, stories & process maps ▪ AI for Process Mapping & Data Analysis - banking workflow tools ▪ HITL Controls - validation frameworks & AI risk assessment	▪ % stories accepted without rework or clarification ▪ Ambiguity score & rework rate on AI-generated artefacts ▪ Time from meeting to agreed requirements ▪ Prompt reuse rate & agent success rate across the team
Developers	▪ UI scaffolding, API stubs, DB migrations & boilerplate on demand ▪ Test scripts, edge cases & regression suites from requirements ▪ Codebases summarised, PRs reviewed & architecture options proposed ▪ **Shift: from writing all code to directing, verifying & governing AI output**	▪ Engineering prompting: precise inputs → production-quality code ▪ HITL code review: security, compliance & correctness of AI output ▪ System design & observability: AI code fits the broader architecture ▪ Testing discipline: owning quality when AI writes the test suite	▪ LLMs & Coding Assistants - Copilot, Claude, Cursor in banking ▪ Prompt Engineering - code generation, debugging & test prompts ▪ AI-Assisted Architecture - evaluating patterns & dependencies ▪ Agentic Development - AI workflows across build, test & deploy	▪ AI code acceptance rate & rework rate ▪ Deployment frequency, change success & defect escape rate ▪ AI defect injection rate - bugs from accepted AI-generated code ▪ Cycle time reduction attributed to AI-assisted delivery
Testers	▪ Test cases, plans & regression suites generated from requirements ▪ Synthetic & edge-case data produced at scale without manual effort ▪ Defects predicted; tests prioritised by risk before execution ▪ **Shift: from writing tests to governing AI quality & validating AI-generated code**	▪ Prompt engineering: precision inputs → complete test coverage ▪ Evaluating AI tests — gaps, false passes & missing edge cases ▪ AI model testing: hallucination, bias & drift in banking features ▪ Risk-based strategy: knowing what still requires human judgement	▪ GenAI & Agentic Foundations for QA - AI in the test lifecycle ▪ AI Test Generation - prompt libraries for cases, edge cases & defects ▪ Testing AI Systems - model validation, hallucination & compliance ▪ AI Test Automation - Mabl, Testim, Copilot in a banking context	▪ AI test case acceptance rate & coverage completeness ▪ Defect detection vs. escape rate - catching what AI misses ▪ Regression cycle time: AI execution vs. manual baseline ▪ HITL accuracy - errors caught in AI-generated test outputs

Illustrative: Role-Based Certification & Learning Pathways

Domain 3 - Phased Delivery Roadmap

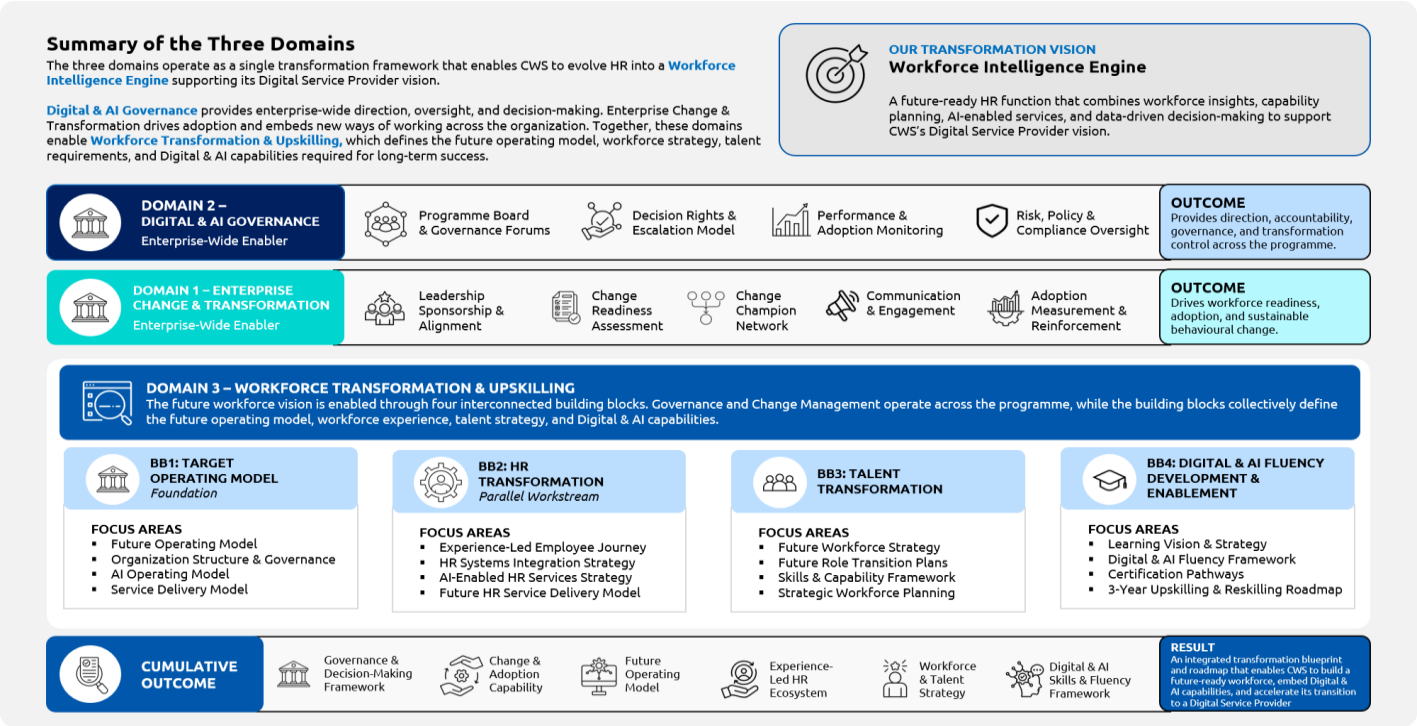

AI Strategy and Governance delivery across the 16 to 20 week engagement, with milestones, workshops, and phase gates

Weeks 1-4	Weeks 5-12	Weeks 13-17	Weeks 18-20
01 Diagnostic & Validation *Weeks 1 to 4*	**02 Strategy Design** *Weeks 5 to 12*	**03 Roadmap & Operating Model** *Weeks 13 to 17*	**04 Handover** *Weeks 18 to 20*
OBJECTIVE Establish a fact-based understanding of the current workforce, operating model, HR ecosystem, skills maturity, and Digital & AI readiness.	**OBJECTIVE** Design the future-state workforce, operating model, workforce experience, and capability framework required to support the Digital and AI vision.	**OBJECTIVE** Develop workforce transition, capability development, and Digital & AI fluency frameworks to enable future workforce readiness.	**OBJECTIVE** Finalize recommendations, validate roadmaps, and transition implementation-ready outputs to CWS.
KEY ACTIVITIES • Review existing workforce insights • Conduct workforce, HR, and leadership workshops • Assess current operating model, workforce capabilities, and HR maturity • Evaluate Digital & AI readiness, role impacts, and skills gaps • Validate transformation priorities and future-state requirements	**KEY ACTIVITIES** • Define Target Operating Model components • Design Experience-Led Workforce Journey • Define HR Systems Integration and AI-Enabled HR Services strategies • Develop Future Workforce Strategy and Role Architecture • Define Skills & Capability Framework aligned to Digital & AI priorities	**KEY ACTIVITIES** • Develop workforce transition recommendations • Define Build / Buy / Borrow / Bot scenarios • Create Digital & AI Skills Taxonomy aligned to SFIA • Design Digital & AI Fluency Framework • Define Learning Vision & Strategy • Develop Upskilling & Reskilling roadmap	**KEY ACTIVITIES** • Executive review sessions • Roadmap prioritization and sequencing • Knowledge transfer workshops • Final blueprint and deliverable handover
DELIVERABLES • Current-State Workforce Assessment • HR Maturity & Experience Assessment • Digital & AI Capability Baseline • Workforce & Skills Gap Assessment • Transformation Design Principles	**DELIVERABLES** • Target Operating Model Framework • Experience-Led Workforce Journey • Future Workforce Strategy • Future Role Architecture • HR Systems Integration Strategy • AI-Enabled HR Services Strategy • Skills & Capability Framework	**DELIVERABLES** • Strategic Workforce Planning Framework • Workforce Transition Roadmap • Digital & AI Skills Taxonomy • Future Skills & Capability Roadmap • Learning Vision & Strategy • Digital & AI Fluency Framework • 3-Year Upskilling & Reskilling Strategy	**DELIVERABLES** • Executive Summary & Roadmap Presentation

Bringing the Three Domains Together

The three domains work together to drive enterprise-wide transformation by aligning governance, organizational change, workforce strategy, and digital capabilities. This integrated approach builds the foundations for a Workforce Intelligence Engine that supports data-driven decision-making and future workforce readiness.

Foundational Dependencies Across the Transformation Programme

Domains 1–3 establish the foundational enablers for the transformation program, providing the governance, change, workforce, and capability foundations required to deliver the broader Digital & AI transformation agenda across other domains.

DOMAIN 1
Enterprise Change & Transformation

Provides the adoption, engagement, communication, and behavioural change foundation required to successfully deliver Domains 4, 5, 7, and 9.

- Adoption
- Communications
- Stakeholder Engagement
- Behaviour Change

DOMAIN 2
Digital & AI Governance

Provides the governance, decision-making, accountability, prioritization, and performance oversight framework underpinning Domains 4, 5, 7, and 9.

- Governance
- Decision Rights
- Accountability
- Performance Oversight

DOMAIN 3
Workforce Transformation & Upskilling

Provides the future operating model, workforce strategy, HR transformation roadmap, talent framework, skills taxonomy, and Digital & AI fluency foundation required to enable Domains 4, 5, 7, and 9.

- Target Operating Model
- Workforce Strategy
- Talent Framework
- Skills & AI Fluency

D. Domain 4 - Customer Experience Transformation

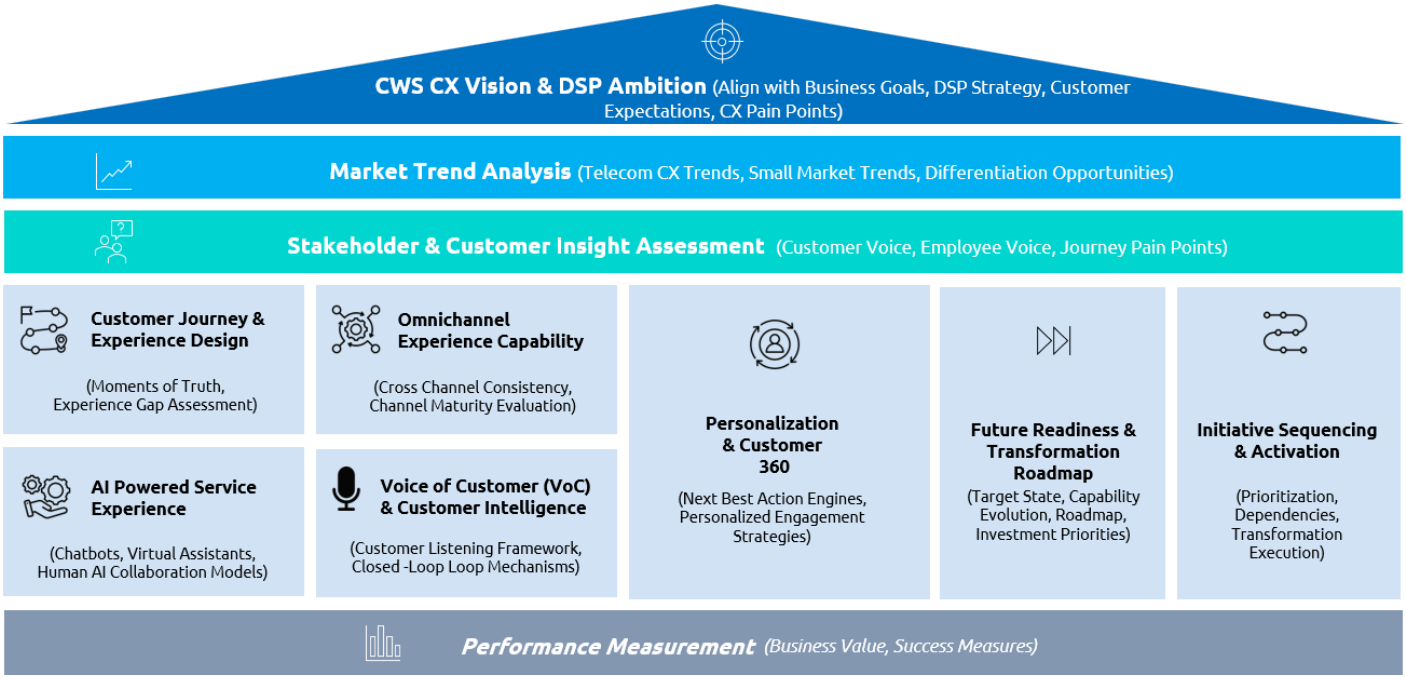

1. Our understanding of your current CX challenges

CWS's current customer experience environment is characterized by fragmented customer data, disconnected platforms, and multiple concurrent CX initiatives that risk creating siloed experiences rather than a unified customer journey. While the organization has a strong ambition to become a Digital Service Provider (DSP), the underlying customer data, process, and integration foundations are not yet mature enough to consistently support a seamless omnichannel experience.

Some Key CX Challenges are-

- **Fragmented customer data and absence of a customer 360 view-**
  - Customer information is distributed across Cerillion and multiple legacy systems.
  - No single source of truth exists for customer, product, operational, and service data.
  - Data fragmentation impacts personalization, customer analytics, and consistent customer interactions.
- **Limited end-to-end visibility** of the customer experience-
  - Customer-facing platforms generate independent dashboards with no unified CX view.
  - Integration with enterprise data and BI capabilities is not yet established.
  - Customer insights are not consistently leveraged across the organization.
  - Real-time customer insights and proactive intervention capabilities are limited.
- **Omnichannel experience maturity is low**
  - Customer interactions span across multiple channels, but orchestration is limited.
  - Service context is not seamlessly shared across channels
- **Heavy dependency on manual processes and human intervention**
  - Customer service teams frequently depend on Technical and Network teams for service validation and issue resolution, resulting in delays.
  - Humans often act as the integration layer between systems.
- **Limitations to AI adoption**
  - Current data quality, integration, and process fragmentation limit scalable AI adoption.

2. Overall Approach for Customer Experience Transformation

Our Customer Experience Transformation approach is designed to help CWS evolve from a collection of customer-facing initiatives into a **cohesive, customer-centric and AI-enabled Digital Service Provider (DSP)**. The approach starts by understanding the current customer experience reality across journeys, channels, customer feedback and supporting systems, before defining the future-state customer experience and a sequenced transformation roadmap. Consistent with CWS's guiding principle of **"Data before AI, Workflow before Automation, Integration before Scale"**, the methodology ensures that foundational customer data, channel and process challenges are addressed before introducing advanced AI, personalization and automation capabilities. The framework also directly addresses the key challenges highlighted in the Customer Centricity discovery, including fragmented customer data, disconnected initiatives (AICC, ticketing, website, chatbot), and the need for a differentiated experience aligned to CWS's DSP ambitions.

2.1 Establishing the Current-State Customer Experience Baseline

We begin by establishing a fact-based understanding of the current customer experience landscape through customer journey diagnostics, channel assessments, stakeholder interviews, customer feedback analysis, and customer-data traceability across the current BSS/CRM ecosystem. This enables the development of a comprehensive understanding of customer pain points, journey breakdowns, channel inefficiencies, and experience gaps impacting customers today.

Role in CX Transformation

This stage provides the evidence base for the entire CX transformation by validating current-state challenges, understanding customer and employee pain points, and identifying the underlying operational and technology drivers impacting customer experience.

Key Outputs

- CX Diagnostic Gap Analysis ReportAssessment of the current customer experience landscape across prioritized customer journeys, service channels, customer feedback mechanisms, and customer data touchpoints. The assessment will validate findings from the inherited discovery reports and identify key customer pain points, operational bottlenecks, experience gaps, and underlying drivers impacting customer experience.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes current-state assessment, key findings, pain points, maturity observations, and recommendations
- **Scope Boundaries**
  - Includes review of existing discovery outputs, stakeholder consultations, representative journey assessments, and customer experience observations.
  - Excludes customer surveys, large-scale customer research, mystery shopping exercises, detailed process mapping, customer analytics implementation, data quality assessments, and operational redesign activities.
  - Prioritized Customer Journey Maps with Pain pointsHigh-level journey maps for prioritized telecom customer journeys, highlighting key customer interactions, friction points, service breakdowns, and opportunities for improvement. The deliverable will include a consolidated pain-point register mapped to the six enterprise systemic failures identified by CWS.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes prioritized journey maps, pain-point categorization, root-cause themes, and opportunity areas
- **Scope Boundaries**
  - Includes representative current-state and future-state journey views for selected high-priority journeys.

- Excludes detailed service design, process re-engineering, customer journey redesign workshops, process documentation, channel redesign, and implementation of customer experience improvements.
- Omnichannel Current-State Assessment and Future state recommendations. Assessment of current omnichannel maturity together with recommended future-state customer engagement principles, target maturity level, and strategic omnichannel vision required to support CWS's Digital Service Provider ambition.

- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes maturity assessment, capability gaps, target-state vision, and strategic recommendations
- **Scope Boundaries**
  - Includes strategic assessment of existing channels and recommended future-state capabilities.
  - Excludes channel implementation planning, channel technology selection, channel integration design, contact-center transformation design, and channel performance management.

2.2 Defining the Future-State Customer Experience Vision

Building on diagnostic findings and market insights, we define the future-state customer experience vision that supports CWS's DSP ambition and establishes the desired customer engagement model across customer journeys, channels, and interactions.

Role in CX Transformation

This component provides a future-state view of how customer experience should evolve, ensuring all CX initiatives align to a common vision and customer-centric design principles.

Key Outputs

- Voice of Customer Analytics Framework - Recommended framework for capturing, analyzing, measuring, and governing customer feedback across key telecom customer lifecycle events. The framework will define customer listening mechanisms, feedback categories, reporting principles, and governance recommendations required to support customer-centric decision making.
- **Output Format**
  - Executive presentation deck
  - Upto **4 slides/pages**
  - Includes VoC framework, measurement model, governance approach, and reporting recommendations
- **Scope Boundaries**
  - Includes high-level VoC strategy and governance recommendations.
  - Excludes survey design, survey implementation, reporting dashboard development, customer analytics configuration, operational reporting, and closed-loop feedback management execution

2.3 Designing a Seamless Omnichannel Experience

A core focus of the approach is the development of a seamless omnichannel experience that enables customers to move effortlessly across channels while maintaining context and continuity.

Role in CX Transformation

This component helps eliminate fragmented customer interactions and creates a unified approach to engagement across assisted and digital channels.

Key Outputs

- Omnichannel Maturity Model - Assessment of CWS's current omnichannel maturity and definition of a target-state maturity model aligned to the Digital Service Provider (DSP) vision. The model will assess key dimensions including customer experience, channels, processes, data, technology, governance, and Digital & AI enablement capabilities.
- **Output Format**
  - Executive presentation deck
  - Upto **4 slides/pages**
  - Includes maturity assessment, target-state positioning, capability gaps, and improvement recommendations
- **Scope Boundaries**
  - Includes strategic assessment and recommended maturity progression aligned to future-state CX objectives.
  - Excludes detailed channel assessments, technology evaluations, platform selection, implementation planning, channel redesign, and operational maturity assessments at departmental level.
- **Future-State Customer Journey Blueprints -** High-level future-state customer journey blueprints illustrating the desired customer experience across selected priority customer journeys aligned to CWS's Digital Service Provider (DSP) vision. The blueprints will identify key customer interaction points, experience principles, channel touchpoints, Digital & AI enablement opportunities, and indicative journey improvements required to support the future-state customer experience strategy.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes future-state journey visualizations, interaction points, experience principles, and Digital & AI enablement opportunities
- **Scope Boundaries**
  - Includes conceptual future-state journey designs for a limited number of prioritized customer journeys identified during the engagement.
  - Excludes detailed service design, business process redesign, user experience (UX) design, journey-level operating procedures, functional requirements, customer research, wireframes, technical specifications, channel implementation designs, and implementation planning.

- Future-state blueprints are intended to illustrate strategic customer experience recommendations and transformation opportunities rather than serve as implementation-ready designs.

2.4 Establishing Voice of Customer & Customer Intelligence Capabilities

The approach formalizes how customer feedback is captured, analyzed, and acted upon across key telecom lifecycle moments.

Role in CX Transformation

This component establishes a structured customer-listening capability that enables continuous experience improvement and customer-centric decision making.

Key Outputs

2.5 Enabling Personalization & Customer 360 Capabilities

The approach creates a foundation for delivering relevant, contextual, and proactive customer interactions by leveraging customer, network, usage, and product information.

Role in CX Transformation

This component enables CWS to move from broad customer communications toward individualized customer engagement, retention, and growth strategies.

Key Outputs

- Customer 360 and Next-Best-Action Model. Strategic framework outlining how customer, product, usage, service, and operational data can be leveraged to support customer segmentation, personalization, retention strategies, and next-best-action decision making in the future-state environment.
- **Output Format**
  - Executive presentation deck
  - Upto **4 slides/pages**
  - Includes Customer 360 vision, personalization principles, use-case examples, and Next-Best-Action framework
- **Scope Boundaries**
  - Includes strategic recommendations and conceptual framework for Customer 360 and personalization capabilities.
  - Excludes Customer 360 solution design, data model design, segmentation development, predictive model development, campaign design, and analytics implementation.

2.6 Embedding AI into Customer Service Operations

The methodology defines how AI can be leveraged across customer service and support interactions while maintaining an appropriate balance between automation and assisted support.

Role in CX Transformation

This component helps improve service responsiveness, digital adoption, self-service utilization, and operational efficiency while supporting CWS's AI ambitions.

Key Outputs

- AI Chatbot & Virtual Assistant Strategy - Strategic assessment and recommendations on the application of AI-enabled customer service capabilities, including potential chatbot and virtual assistant use cases, operating principles, governance considerations, and implementation priorities aligned with CWS's Digital & AI strategy.
- **Output Format**
  - Executive presentation deck
  - Upto **4 slides/pages**
  - Includes use cases, capability model, benefits, risks, and implementation considerations
- **Scope Boundaries**
  - Includes strategic recommendations and indicative use-case assessment.
  - Excludes chatbot design, conversational design, knowledge-base development, AI model selection, technology procurement, chatbot implementation, testing, training, or deployment
  - Future-State Customer Journey Blueprints. High-level future-state customer journey blueprints illustrating the desired customer experience across selected priority customer journeys aligned to CWS's Digital Service Provider (DSP) vision. The blueprints will identify key customer interaction points, experience principles, channel touchpoints, Digital & AI enablement opportunities, and indicative journey improvements required to support the future-state customer experience strategy.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes future-state journey visualizations, interaction points, experience principles, and Digital & AI enablement opportunities
- **Scope Boundaries**
  - Includes conceptual future-state journey designs for a limited number of prioritized customer journeys identified during the engagement.
  - Excludes detailed service design, business process redesign, user experience (UX) design, journey-level operating procedures, functional requirements, customer research, wireframes, technical specifications, channel implementation designs, and implementation planning.
  - Future-state blueprints are intended to illustrate strategic customer experience recommendations and transformation opportunities rather than serve as implementation-ready designs.

2.7. Translating Strategy into an Executable Roadmap

The future-state customer experience vision is translated into a practical implementation roadmap that aligns ongoing and planned initiatives across customer service, channels, and enabling technologies.

Role in CX Transformation

This component ensures future investments are sequenced appropriately, reducing fragmentation risk and maximizing value realization.

Key Outputs

- CX Transformation Roadmap (0–36 Months) - A high-level roadmap outlining the sequencing of customer experience initiatives, business priorities, governance recommendations, capability requirements, technology dependencies, and implementation considerations required to support the 0-36 month CX transformation journey.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes roadmap, transformation priorities, target operating model, KPI recommendations, and sequencing guidance
- **Scope Boundaries**
  - Includes strategic sequencing recommendations, governance considerations, KPI framework, and implementation guidance.
  - Excludes detailed project plans, operating model implementation, business case development for individual initiatives, resource planning, organizational redesign, and transformation delivery support.
  - Sequencing Recommendations for AICC, PBX, Ticketing & Chatbot. - Strategic sequencing recommendations for customer service platform initiatives, including AICC, PBX, Ticketing, Chatbot, and related CX capabilities, identifying key dependencies, priorities, integration considerations, and indicative implementation sequence required to support a coherent customer experience transformation journey.
- **Output Format**
  - Executive presentation deck
  - Upto **3 slides/pages**
  - Includes dependency analysis, sequencing recommendations, and priority roadmap
- **Scope Boundaries**
  - Includes high-level sequencing guidance and dependency mapping.
  - Excludes solution architecture, platform evaluation, vendor selection, implementation planning, technical design, migration planning, or detailed project scheduling.
- **CX Target Operating Model -** High-level Customer Experience Target Operating Model outlining recommended governance structures, customer-centric operating principles, capability requirements, organizational considerations, and Digital & AI enablement mechanisms required to support the future-state customer experience strategy.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes operating model components, governance recommendations, capability requirements, and future-state operating principles
- **Scope Boundaries**
  - Includes conceptual operating model recommendations aligned to CX transformation objectives.
  - Excludes organization redesign, workforce restructuring, detailed process design, role descriptions, operating procedures, resource models, and implementation support.
- **Prioritized CX Business Use Cases -** Recommended portfolio of prioritized CX-related Digital, Data, Automation, and AI use cases based on business value, customer impact, feasibility, dependency considerations, and strategic alignment with the CWS transformation roadmap.
- **Output Format**
  - Executive presentation deck
  - Upto **4 slides/pages**
  - Includes use-case inventory, prioritization rationale, value assessment, and indicative sequencing
- **Scope Boundaries**
  - Includes high-level use-case prioritization and strategic recommendations.
  - Excludes business requirements gathering, detailed solution design, business case development for individual use cases, effort estimation, implementation planning, or technology selection.
- **CX KPI & Measurement Framework -** Recommended framework for measuring customer experience performance, transformation progress, and value realization through a structured set of CX, operational, and adoption KPIs aligned to the Digital Service Provider strategy.
- **Output Format**
  - Executive presentation deck
  - Upto **4 slides/pages**
  - Includes KPI categories, measurement principles, governance recommendations, and reporting approach
- **Scope Boundaries**
  - Includes proposed KPI framework and measurement recommendations.
  - Excludes dashboard development, reporting tool selection, data integration, KPI implementation, operational reporting processes, and ongoing performance management activities.

2.8. Driving Governance, Measurement & Value Realization

The final component focuses on ensuring that CWS can successfully govern, measure, and continuously improve customer experience outcomes after the strategy is completed.

Role in CX Transformation

This component establishes the mechanisms required to track progress, measure benefits, and sustain customer-centric decision making.

Key Outputs

- Knowledge Transfer Pack & Executive CX Strategy Presentation Executive summary of customer experience transformation findings, recommendations, target-state vision, roadmap, governance approach, and key implementation considerations required to transition ownership to CWS stakeholders.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes executive summary, strategic recommendations, roadmap highlights, and implementation considerations
- **Scope Boundaries**
  - Includes executive readout and knowledge transfer of deliverables produced within this domain.
  - Excludes operational training, implementation support, change management activities, workshop facilitation beyond agreed sessions, and ongoing advisory services.
- **Domain 4 Deliverable Boundaries**
  - All Domain 4 deliverables are advisory and strategy-oriented in nature and are intended to define the customer experience vision, governance framework, capability requirements, roadmap, and strategic recommendations required to support CWS's Digitalization & AI Strategy.
  - Deliverables will leverage existing discovery outputs and focus on validation, prioritization, and future-state design principles rather than conducting extensive primary research or detailed service design.
  - Unless explicitly stated, individual deliverables will be limited to 4-5 slides/pages per output and delivered as executive-level presentation artefacts. The scope excludes customer surveys, service design activities, process redesign, solution architecture, platform selection, chatbot implementation, Customer 360 implementation, analytics development, dashboard development, channel transformation delivery, and operational execution support.

3. Our Methodology

Phase	Objective	Key activities	Deliverables/Outcome
Phase 1: CX Diagnostic & Baseline Validation	Establish a fact-based understanding of the current customer experience landscape, pain points and validate findings from the eight discovery reports.	• Absorb the Customer Centricity discovery and all seven other discovery outputs, and reconcile them against the 57-initiative catalogue • Conduct Stakeholder interviews; Map and walk the core telecom lifecycle journeys end-to-end — acquisition & SIM activation/provisioning, onboarding, usage & recharge/top-up, billing & payments, fault report-to-resolution (service assurance), plan/bundle changes, roaming, and disconnection/win-back — across consumers (including tourists) prepaid and postpaid, enterprise/government segments • Benchmarking against comparable island and regional operators (channel mix, self-care adoption, digital containment, NPS, churn) • Assess current service channels (Call Center, Website, Email, WhatsApp, Chat, etc.) including on-floor CC observation. • Assess current VoC mechanisms at key telecom moments (post-activation, post-fault, post-billing, post-interaction) • Review the customer data and systems landscape across the BSS/CRM (Cerillion) and legacy stack — billing/charging, order & provisioning, trouble-ticketing and network/service-assurance feeds — assessing single-customer-view readiness	• CX Diagnostic Gap analysis Report (independent view of current-state CX maturity, calibrated against the 8-discovery baseline) • Prioritized customer journey maps with pain points • Pain-Point Register (tagged against six enterprise systemic failures) • Omnichannel Current-State Assessment
Phase 2: CX Strategy Design	Design the future-state customer experience architecture, operating principles, and AI-enabled engagement model	• Design the Voice-of-Customer framework anchored to telecom lifecycle triggers (activation, fault restoration, billing, recharge, roaming) with closed-loop follow-up • Design the Omnichannel Maturity Model and target-state CX architecture spanning contact center, IVR/USSD, self-care app, web, messaging, retail and dealer channels • Define the Customer 360 and personalization strategy using telecom signals — product holding (mobile/fixed/broadband), usage and network	• Voice of Customer Analytics Framework • Omnichannel Maturity Model • Next-Best-Action Model • AI Chatbot & Virtual Assistant Strategy • Future-State Customer Journey Blueprints

		experience, device, tenure and payment behaviour — across prepaid/postpaid and consumer/enterprise • Develop the Next-Best-Action framework balancing retention/churn, ARPU growth and proactive network/service care, driven by usage and service-event triggers • Define the AI chatbot & virtual-assistant strategy around high-volume telecom intents (balance & top-up, data-bundle purchase, bill queries, fault reporting, SIM/plan changes) with containment/deflection targets • Conduct leadership co-creation workshops to validate future-state journeys and the AI-enabled engagement model	
Phase 3: CX Roadmap & Operating Model	Translate the CX strategy into an executable roadmap, operating model, sequencing plan, and value-realization business case.	• Assess initiative interdependencies across the platform spine — AICC, PBX, ticketing, website and chatbot — and their links to BSS/OSS, CRM and charging/mediation • Develop phased implementation roadmap • Define target CX operating model and governance • Define CX KPIs and value-realization measures in telecom terms — churn, ARPU, NPS/CSAT, first-contact resolution, average handle time, fault mean-time-to-restore, activation turnaround, digital containment/deflection, and complaints per 1,000 subscribers • Develop the CX business case and prioritization scenarios (value vs. effort, tied to churn, ARPU and cost-to-serve)	• CX Transformation Roadmap (0-36 months) • Sequencing Recommendations for AICC, PBX, Ticketing & Chatbot (against eleven-item platform spine) • CX Target Operating Model • CX KPI & Measurement Framework • Prioritized CX Business use cases
Phase 4: CX Handover & Enablement	Enable CWS to own, govern, and execute the CX transformation through knowledge transfer, governance mechanisms, and implementation-ready artefacts.	• Executive review and roadmap validation with leadership • Define governance, monitoring and closed-loop VoC mechanisms for ongoing CX management • Conduct knowledge-transfer workshops with care, digital, network and commercial teams • Align CX roadmap with broader Digitalization & AI Strategy	• Executive CX Strategy Presentation • Knowledge Transfer Pack

4. Approach for Customer journey Diagnostic and Pain point mapping

Objective: Assess and quantify customer experience gaps across priority customer journeys, identifying the underlying operational, process, data and technology drivers impacting customer satisfaction and service delivery. The assessment will establish a fact-based CX baseline and provide the foundational inputs required for the Voice of Customer framework, Omnichannel Maturity Model, AI-enabled service strategy, Personalization Framework, and future-state CX roadmap

Wave 1 — Journey Scoping

Working with CWS stakeholders, identify and prioritise the journeys warranting deep-dive treatment based on customer volume, business criticality, and known friction (e.g., onboarding, billing, fault reporting, plan management, escalations). This ensures the diagnostic effort is concentrated where it will yield the greatest strategic value, rather than attempting uniform coverage across every possible interaction.

Wave 2- Stakeholder Interviews: Journey Walkthroughs & Pain-Point Mapping

Conduct structured interviews with CWS stakeholders spanning customer-facing and operational functions (contact centre, technical/network, and digital teams) to walk through each priority journey stage by stage. Each walkthrough captures the intended process, the systems and channels involved, and the points at which the experience diverges from expectation. Pain points are logged against each journey stage, capturing both the nature of the breakdown and the stakeholder's view of its root driver.

Wave 3- Journey Map Consolidation & Prioritisation

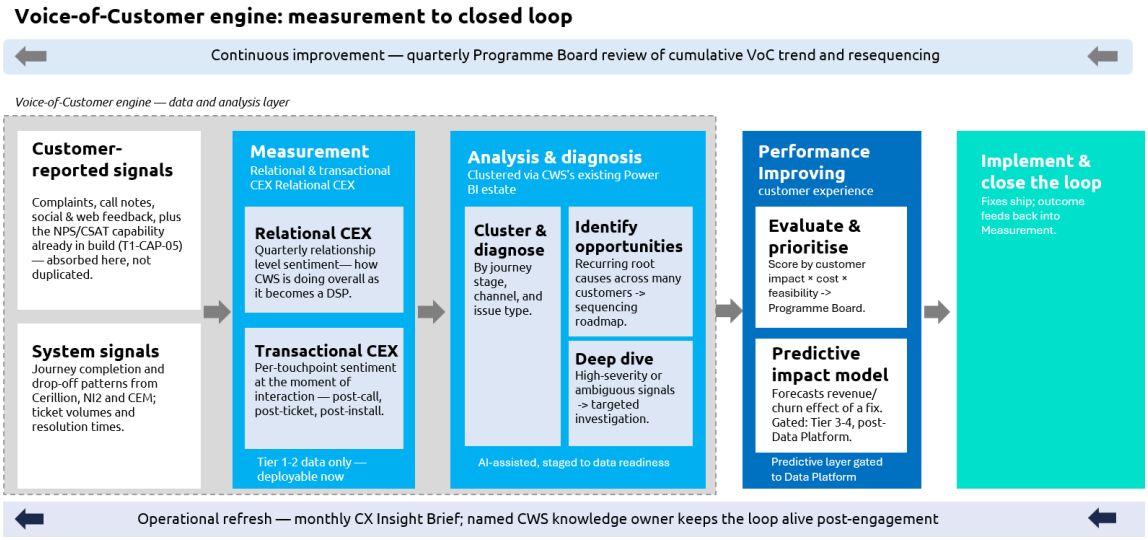

Synthesise the walkthrough findings into a consolidated set of current-state journey maps, with pain points overlaid at the relevant stage. It also includes identification and prioritization of critical customer interactions requiring redesign and opportunities to create customer experience differentiation.

Wave 4- Pain point Register

Each prioritised pain point is logged in a structured register and tagged against the six enterprise systemic failure categories, enabling the pattern across individual pain points to be read at a structural level

Wave	Key Objective	Primary Output
Journey Scoping	Stakeholder alignment on journey prioritisation criteria	Shortlist of priority journeys
Stakeholder Interviews	Priority journey walkthroughs and pain-point capture across customer-facing and operational functions	Raw pain-point inventory by journey stage
Journey Map Consolidation	Synthesis of walkthrough findings; identification of opportunities to improve customer experience	Prioritised journey maps with pain points overlaid
Pain-Point Register & Tagging	Structural classification of pain points against six enterprise systemic failure categories	Pain-Point Register tagged against systemic failures

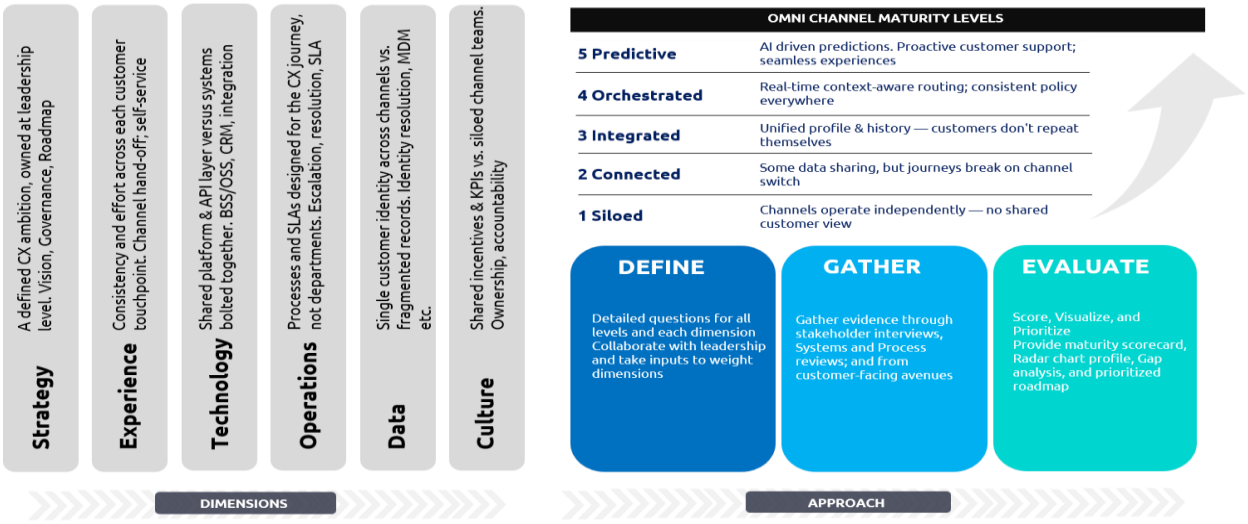

5. VOC framework

1. **Signals in —** customer-reported (complaints, calls, social) and system-generated (Cerillion/NI2/CEM data) feed in.
2. **Measurement —** split into overall relationship sentiment (Relational CEX) vs. moment-of-interaction sentiment (Transactional CEX).
3. **Analysis & Diagnosis —** clusters signals to spot systemic issues ("Identify opportunities") or investigates severe one-offs ("Deep dive").
4. **Performance —** scores and prioritises fixes now; a predictive model (gated until the data platform is ready) forecasts revenue/churn impact.
5. **Implement & Close the Loop —** fixes ship, and results feed back into Measurement.

Two loops keep it alive: a **quarterly strategic review** (top) and a **monthly operational refresh** (bottom) — so it's a living cycle, not a one-time report.

6. Omni Channel Maturity

For the consumers (B2B/B2C) of telecom service, what matters more than the channel is how they perceive the relationship and the experience across various channels through which they interact with the organization. Can a transaction start through one channel be taken over and completed through another channel? Does self-service options as much comfort as the consumer expects? Does your organization see and treat the customer as one, or do you see them as different consumers across different channels?

Aligning with the industry standards for telecom/CSP organizations, the framework measures maturity across six dimensions – **Strategy**, **Experience**, **Technology**, **Operations**, **Data**, & **Culture**.

A maturity ladder is proposed with five levels – **Siloed**, **Connected**, **Integrated**, **Orchestrated**, and **Predictive** – in the increasing order of maturity.

Typical definitions of the 5-levels are:

1. Siloed: channels operate independently
2. Connected: some data sharing exists, but journeys break on channel switch
3. Integrated: unified profile and history; customers don't repeat themselves
4. Orchestrated: real-time, context-aware routing and consistent policy everywhere
5. Predictive: AI-driven anticipation of customer needs, proactive engagement

The assessment will be run with an approach of **Define, Gather, and Evaluate** stages. In the Define stage, a definition of the scale will be written to establish what each level of maturity looks like across the six dimensions. In the next stage, evidence will be gathered through various engagements. Stakeholder interviews that involve channel owners, service reps, IT and customer service leadership will be conducted. A review of existing processes & systems includes understanding of the CRM/BSS architecture, data flow diagrams, and channel-specific SOPs. Customer facing evidence may include journey walkthroughs, complaint ticket analysis for handoff failures, and mystery shopping across channels. The Evaluate stage basically comprises scoring, visualizing, and prioritizing to establish levels across dimensions. A maturity heatmap or a radar chart will be used to show the maturity levels and understanding the gaps. Each dimension's target vs current gap feeds into various workstream for future improvements.

7. Next Best Action (NBA)

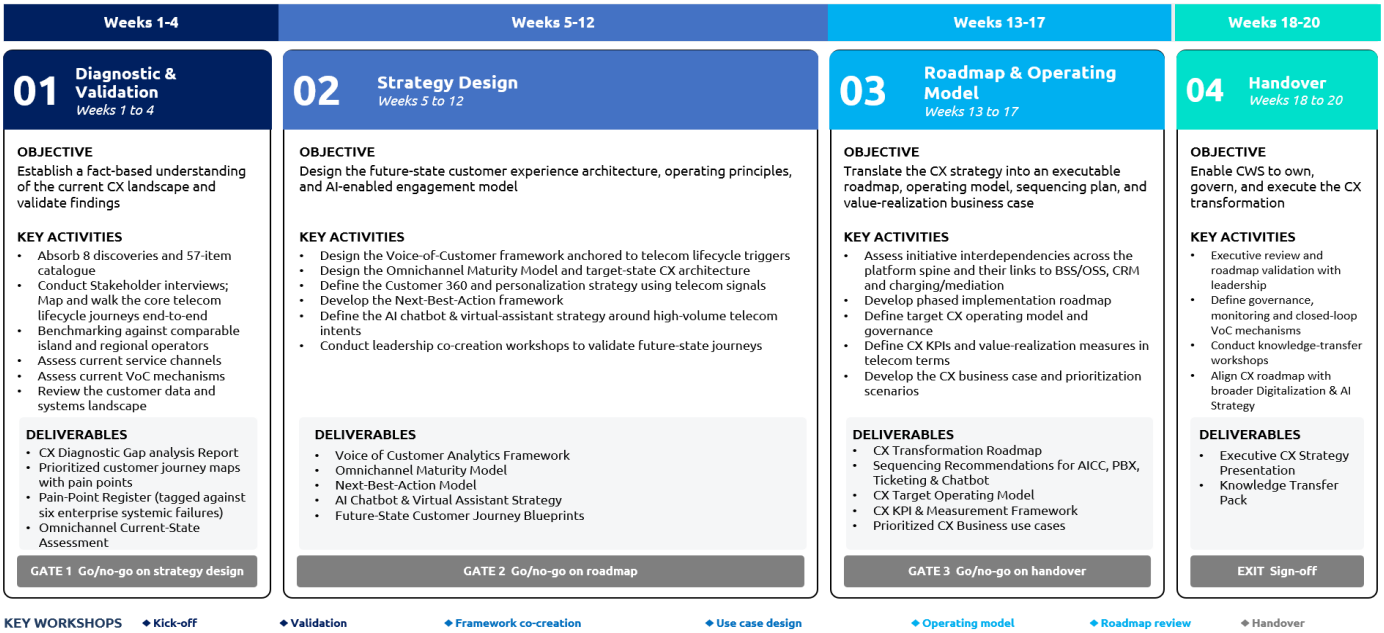

Given Seychelle has a relatively small population and the unique mix of residents and international tourists, the Next Best Action (NBA) strategy should serve as a key decision-enablement framework for customer relationship management. The strategy will help identify the most relevant and timely actions required to strengthen customer engagement, improve retention, and maximize long-term value. The success of the NBA strategy will ultimately be measured by its ability to reduce customer churn, enhance customer loyalty, and increase customer lifetime value across different customer segments.

The key principles that will define the NBA strategy would be:

1. **Focus more on retention than acquisition**. The NBA value equation shall weight churn prevention and lifetime-value protection more heavily
2. **Reduce over-contacting:** Contact fatigue negatively impacts relationships as they are personal and word of mouth travels fast island-wide.
3. **Start with available data:** Consider data from unified BSS/OSS systems that gives billing, usage, product holding tenure, payment behavior, and network/service events. With this start with rules-and-propensity based NBA rather than starting on a big ML platform.
4. **Hold NBA push for high-value segments:** For enterprise and government accounts, NBA should enable the relationship managers with decision support. It should not auto-push recommendations.
5. **Base actions on segment lifecycles:** A resident is a multi-year relationship (retention, cross-sell, care), but a tourist is a few days-long one (arrival data-pass, top-up-before-expiry, done). Mixing these segments will impact the resident experience

Domain 4 - Phased Delivery Roadmap

Customer Experience Transformation consulting across the 16 to 20 week engagement, with milestones, workshops, and phase gates

E. Domain 5 - Data Strategy and Advanced Analytics

Our Understanding of CWS's Data and Analytics Challenges

1. Data is fragmented across multiple platforms (Cerillion, NI2, AX/D365, LATRO, ticketing systems), resulting in no single source of truth.
2. Critical business information remains trapped in unstructured formats such as emails, Excel files, PDFs, and scanned documents.
3. Limited integration between systems forces employees to act as the manual integration layer, creating inefficiencies and operational risks.
4. Lack of enterprise-wide, real-time visibility constrains proactive decision-making and reduces operational agility.
5. Inconsistent data quality, ownership, and governance hinder trust in reporting and analytics outcomes.
6. Existing analytics capabilities and data assets are underutilized due to fragmented data architecture and siloed information.
7. CWS's AI ambitions are challenged by foundational gaps in data management, integration, and governance, reinforcing the need for a **"Data before AI"** approach.
8. The data strategy must align with ongoing transformation programs (D365 F&O, LATRO, Microsoft 365 ecosystem) while supporting CWS's transition to a data-driven Digital Service Provider (DSP)

Our Approach

1. Assess and Validate the Current Data Landscape

Activities

- Review existing discovery outputs and validate key findings.
- Assess current data maturity, governance, quality, architecture, integration, and reporting capabilities.
- Identify critical data gaps, redundancies, and risks across customer, network, finance, and operational domains.
- Validate current data ownership, governance structures, business accountability, and reporting requirements with Domain 2 stakeholders.
- Assess workforce data literacy and analytics adoption requirements in collaboration with Domain 3.

Cross-Domain Integration

- Domain 2 (Governance): Uses inputs on governance structures, ownership models, and executive reporting requirements to produce current-state governance findings.
- Domain 3 (Data Capability): Uses inputs on skills gaps and data literacy requirements to deliver a data capability maturity assessment.
- Domain 7 (Operations & Data Quality): Uses inputs on operational pain points, workflow inefficiencies, and KPI challenges to generate a data quality assessment.

2. Define the Enterprise Data Vision

Activities

- Establish a clear target-state data vision aligned with the DSP transformation strategy.
- Define how data will support Customer Experience, Revenue Growth & Protection, and Operational Efficiency objectives.
- Develop guiding principles for data management, ownership, accessibility, security, and data sharing.

Cross-Domain Integration

- Domain 4 (Customer Experience): Uses inputs on customer experience objectives and customer journey priorities to define the customer data vision and Customer 360 foundation.
- Domain 8 (Commercial Growth): Uses inputs on commercial growth objectives and digital revenue ambitions to establish the strategic data monetization direction.
- Domain 9 (AI Strategy & Governance): Uses inputs on AI strategy objectives and governance requirements to create an AI-ready data vision and governance alignment.

3. Design the Target Data Architecture

Activities

- Define the future-state architecture covering operational, analytical, master, and AI-ready data.
- Establish the Enterprise Data Platform roadmap.
- Define high-level source-to-target data flows from Cerillion, NI2, D365, LATRO, and other Microsoft platforms into the Enterprise Data Platform (EDP), including ingestion requirements, data movement across bronze, silver, and gold layers, and data delivery to downstream consumption and reporting layers.
- Define master data management approaches for customer, network, product, and financial data domains.

Cross-Domain Integration

- Domain 6 (Enterprise Architecture & Integration): Uses inputs on enterprise architecture principles, cloud strategy, and integration architecture requirements to define Enterprise Data Platform and integration requirements.
- Domain 4 (Customer Experience & Analytics): Uses inputs on customer analytics and personalization requirements to establish Customer 360 and personalization data foundations.
- Domain 9 (AI Strategy & Platforms): Uses inputs on AI platform and training data requirements to create an AI-ready data architecture and trusted training data frameworks.

4. Establish Data Governance Foundations

Activities

- Design an enterprise data governance framework including ownership, stewardship, quality standards, metadata, and classification policies.
- Align governance with Seychelles Data Protection requirements and future AI governance objectives.
- Define accountability structures and governance forums for sustained data management.

Cross-Domain Integration

- Domain 2 (Governance & Accountability): Uses inputs on governance bodies, escalation paths, executive accountability structures, and AI governance requirements to define the data ownership model, governance council structure, and KPI governance.
- Domain 3 (Data Capability & Stewardship): Leverages governance and accountability inputs to establish data stewardship and capability requirements.
- Domain 9 (AI Governance & Data Controls): Uses inputs on AI governance requirements and data classification controls to create the data classification framework, AI training data governance, and quality controls.

5. Prioritize Analytics Use Cases

Activities

- Identify and assess high-value analytics opportunities across customer, network, finance, revenue assurance, and operational domains.
- Prioritize use cases based on business value, feasibility, data readiness, and risk.
- Establish the progression from descriptive to predictive and prescriptive analytics.

Cross-Domain Integration

- Domain 4 (Customer Analytics & Personalization): Uses inputs on customer analytics opportunities to identify customer journey analytics, segmentation, and personalization opportunities.
- Domain 7 (Operational Performance & Automation): Uses inputs on operational performance and automation opportunities to drive operational analytics and automation prioritization.
- Domain 8 (Revenue Growth & Monetization): Uses inputs on revenue growth and monetization priorities to define revenue intelligence and data monetization opportunities.

6. Build an Enterprise Data & Analytics Roadmap

Activities

- Sequence initiatives based on dependencies and platform readiness.
- Align delivery with D365 F&O implementation, LATRO evolution, and ongoing quick-win initiatives.
- Define phased milestones, investment priorities, KPIs, and expected business outcomes.

Cross-Domain Integration

- Domain 6 (Technology Architecture): Uses inputs from the technology architecture roadmap to align and sequence data, integration, and platform initiatives across the enterprise.
- Domain 7 (Automation), Domain 8 (Commercial Growth), and Domain 9 (AI Capabilities): Uses inputs from automation, commercial growth, and AI capability roadmaps to prioritize and coordinate analytics, automation, and AI initiatives.
- Enterprise-Wide Outcome: Delivers a foundational transformation roadmap that supports D365, LATRO, Digitalization, Automation, and Enterprise AI adoption through coordinated sequencing of data and business capabilities.

7. Enable a Data-Driven Organization

Activities

- Define operating model, roles, and capabilities required to sustain data-led decision making.
- Recommend skills development and data literacy initiatives.
- Establish the foundation for scalable AI adoption through trusted, governed, and high-quality data.

Cross-Domain Integration

- Domain 2 (Executive Governance & Decision Intelligence): Provides executive dashboards, KPI governance, and a decision intelligence framework to support data-driven leadership and oversight.
- Domain 3 (Data Capability & Stewardship): Delivers data literacy, stewardship, and analytics capability development to strengthen organizational data maturity.
- Domain 7 (Operational Performance) & Domain 9 (AI Governance): Enables operational KPI frameworks and performance dashboards (Domain 7), while establishing an AI operating model, AI data governance, and trusted data foundations

8. Identify and Classify Monetizable Data Assets

Activities

- Establish a CWS data monetization framework that identifies high-value customer, network, usage, roaming, and location data assets.
- Assess opportunities for data products, analytics-driven services, and AI-enabled commercial offerings.
- Leverage advanced analytics for next-best-offer recommendations, churn reduction, bundle optimization, and revenue assurance.
- Ensure compliance through privacy, consent management, anonymization, and Seychelles Data Protection Act requirements.

Cross-Domain Integration

- Domain 8 (Commercial Strategy & Growth): Uses inputs on commercial strategy, digital product roadmap, revenue growth objectives, and partner ecosystem priorities to identify a monetizable data asset inventory and data product opportunities.
- Domain 8 (Revenue Intelligence): Leverages commercial and growth priorities to define revenue analytics opportunities that support business performance and decision-making.
- Domain 8 (Customer Value & Monetization): Delivers churn and customer value insights along with data monetization business cases to drive new revenue streams and improve customer retention.

Our Methodology

Our methodology follows a **Data Foundation → Governance → Analytics → AI Readiness approach,** aligned with CWS's strategic principle of ***"Data before AI. Workflow before Automation. Integration before Scale."***

Phase 1: Diagnostic & Validation

Objective: Establish a clear understanding of CWS's current data landscape and validate the inherited discovery findings.

Activities

- Review existing discovery outputs and the 57-initiative catalogue.
- Conduct data maturity and analytics capability assessment.
- Assess data quality, ownership, governance, and current reporting capabilities.
- Identify key data domains, systems, integration gaps, and pain points.

Outputs

- Data maturity assessment - Assessment of CWS's current data management, governance, analytics, integration, reporting, and AI-readiness capabilities. The assessment will leverage existing discovery outputs, stakeholder consultations, and available enterprise information to establish a high-level baseline of current-state maturity.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes maturity assessment, key findings, capability gaps, risks, and recommendations
- **Scope Boundaries**
  - Includes enterprise-level maturity assessment and gap identification.
  - Excludes detailed system audits, data profiling, data quality remediation, technical assessments, metadata analysis, and tool-specific evaluations.
  - Data landscape and gap analysis. - High-level assessment of the current enterprise data landscape, data flows, major systems, data domains, integration challenges, reporting limitations, and data management gaps impacting CWS's Digital & AI transformation objectives.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes current-state landscape view, key gaps, challenges, dependencies, and recommendations
- **Scope Boundaries**
  - Includes strategic assessment of major systems, data domains, and enterprise-level challenges.
  - Excludes detailed source-to-target mapping, interface analysis, data lineage analysis, entity modeling, data dictionary creation, and technical design activities.

Phase 2: Strategy Design

Objective: Develop a future-state vision and target architecture that positions data as a strategic enterprise asset, enabling integrated, trusted, analytics-driven, and AI-ready capabilities across CWS.

Activities

- Define the enterprise data vision, guiding principles, and strategic objectives aligned to CWS's DSP transformation.
- Establish the enterprise data governance framework, including data ownership, stewardship, quality, security, and data classification models.
- Identify and prioritize business capabilities and value opportunities enabled through data and advanced analytics.
- Design the target-state data architecture
- Assess and prioritize analytics use cases

Outputs

- Enterprise Data Strategy Document - Future-state Enterprise Data Strategy defining the vision, guiding principles, strategic objectives, capability priorities, governance direction, and key initiatives required to support CWS's transition to a data-driven Digital Service Provider and AI-enabled enterprise.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes vision, principles, strategic pillars, capability priorities, and transformation objectives
- **Scope Boundaries**
  - Includes strategic direction and recommendations.
  - Excludes implementation planning, data management procedures, solution selection, technology procurement, and operational governance implementation.
- **Design Data Governance Framework -** High-level Data Governance Framework outlining recommended governance structures, ownership principles, stewardship concepts, accountability mechanisms, data management policies, and governance forums required to support Digital & AI initiatives.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes governance structure, roles, responsibilities, operating principles, and governance recommendations
- **Scope Boundaries**
  - Includes governance recommendations and conceptual operating principles.
  - Excludes policy creation, governance operating procedures, council setup, stewardship assignment, governance tooling selection, and governance execution activities.

- **Target Data Architecture Blueprint. -** Conceptual future-state data architecture illustrating key data domains, major platform components, integration principles, analytical capabilities, and AI-enablement foundations required to support the target operating environment.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes conceptual architecture diagrams, capability layers, integration principles, and future-state recommendations
- **Scope Boundaries**
  - Includes conceptual architecture recommendations and strategic design principles.
  - Excludes detailed architecture design, logical or physical data models, source-to-target mappings, platform selection, infrastructure sizing, security design, and implementation blueprints.
  - Data Analytics Use Case Prioritisation. Prioritized portfolio of business, operational, customer, revenue, automation, and AI-related analytics opportunities assessed against business value, feasibility, readiness, and strategic relevance.
- **Output Format**
  - Executive presentation deck
  - Upto **4 slides/pages**
  - Includes use-case inventory, prioritization framework, value assessment, and implementation sequencing recommendations
- **Scope Boundaries**
  - Includes strategic use-case prioritization and recommendations.
  - Excludes use-case implementation plans, functional requirements, data science activities, predictive model development, proof of concepts, and business case development for individual use cases.
- **Data Commercial Monetisation Assessment Report -** Assessment of potential opportunities to monetize CWS data assets through analytics products, commercial data services, customer insights, and AI-enabled opportunities aligned to regulatory and privacy considerations.
- **Output Format**
  - Executive presentation deck
  - Upto **4 slides/pages**
  - Includes opportunity assessment, monetization themes, indicative value drivers, and strategic recommendations
- **Scope Boundaries**
  - Includes strategic assessment of monetization opportunities.
  - Excludes market validation, detailed product design, pricing models, commercial negotiations, business case validation, regulatory compliance assessments, and implementation planning.

Phase 3: Roadmap & Operating Model

Objective: Define Target operating model and craft 3-year roadmap to support CWS's transition into a Digital Service Provider (DSP).

Activities

- Define Roles & Responsibilities across different CWS's domains & business functions
- Define workflows & processes for data governance
- Establish success measures and monitoring framework.

Outputs

- Target Operating Model - High-level Data & Analytics Target Operating Model defining governance principles, organizational responsibilities, operating mechanisms, capabilities, and management considerations required to sustain enterprise data management and AI readiness.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes operating model structure, governance components, capability requirements, and function interactions
- **Scope Boundaries**
  - Includes conceptual operating model recommendations.
  - Excludes organizational restructuring, job descriptions, staffing plans, reporting structures, process redesign, and operating model implementation.
  - 3-Year Data & Analytics Roadmap. Prioritized roadmap outlining the sequencing of Data, Analytics, Governance, Integration, and AI-enablement initiatives required to achieve the future-state vision.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Includes initiatives, dependencies, priorities, milestones, and implementation guidance
- **Scope Boundaries**
  - Includes strategic roadmap recommendations and sequencing guidance.
  - Excludes detailed project plans, delivery schedules, resource plans, implementation management, vendor onboarding, or execution support.

Phase 4: Handover & Enablement

Objective: Conduct executive review and do necessary transition to CWS stakeholders

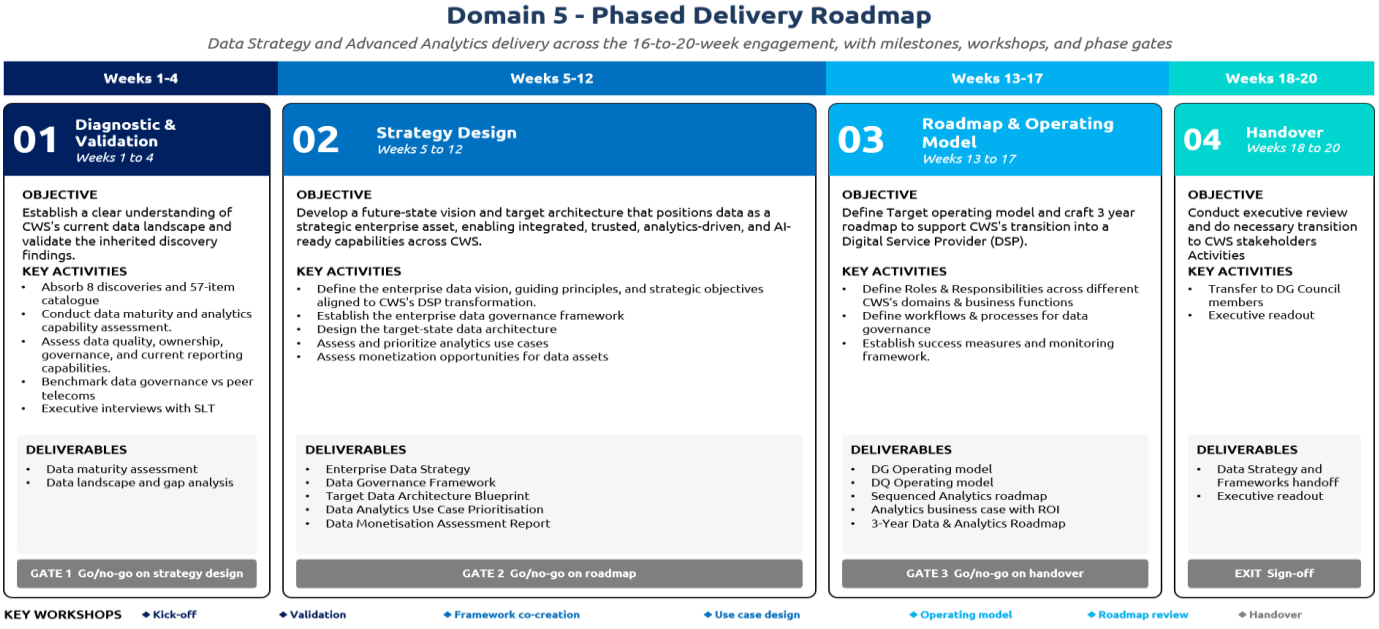

Activities

- Schedule executive review sessions and incorporate feedback
- Align dependencies with D365 F&O, LATRO, and Quick Wins initiatives.
- Perform Knowledge Transfer sessions

Outputs

- Executive Readout - Executive-level summary of findings, recommendations, roadmap priorities, operating model considerations, governance recommendations, and strategic decisions required to support implementation planning.
- **Output Format**
  - Executive presentation deck
  - Upto **5 slides/pages**
  - Executive summary and board-level recommendations
- **Scope Boundaries**
  - Includes presentation and review of Domain 5 outputs.
  - Excludes implementation workshops, design validation exercises, governance operations, and ongoing advisory support.
  - Knowledge Transition - Structured handover of all Domain 5 outputs, assumptions, recommendations, frameworks, and roadmap artefacts to designated CWS stakeholders.
- **Output Format**
  - Knowledge transfer session
  - Supporting handover document
  - Upto **3 slides/pages**
- **Scope Boundaries**
  - Includes walkthrough of deliverables and assumptions.
  - Excludes training delivery, capability development programs, operational support, mentoring, or post-engagement advisory services.
- **Domain 5 Deliverable Boundaries**
  - All Domain 5 deliverables are advisory and strategy-oriented in nature and are intended to define the future-state Data, Analytics, Governance, Architecture, and AI-readiness direction required to support CWS's Digitalization & AI Strategy.
  - Unless explicitly stated, individual deliverables will be limited to 4-5 slides/pages per output and delivered as executive-level presentation artefacts.
  - The engagement will focus on validation, assessment, prioritization, and future-state recommendations rather than detailed architecture design or implementation planning.

Our Phased Delivery Roadmap

Our Data Governance Accelerators

Our Data Governance Tools & Accelerators

DATA GOVERNANCE QUICKSTART MODEL
A foundational framework for efficiently implementing data governance

STAKEHOLDER ANALYSIS
Tools and templates for stakeholder mapping and capturing insights from stakeholder interviews

TARGET STATE VISION DEVELOPMENT
Framework for developing and aligning on data usage & governance goals

CURRENT STATE & GAP ASSESSMENT
Comparative analysis of existing versus ideal data governance states

DATA GOVERNANCE PROCESS DESIGN
Process diagrams and workflows designed to streamline and govern data management practices

ORG STRUCTURE & DECISION FRAMEWORK
Organizational design templates to establish clear roles and governance hierarchies

RAPID ACTION PLAN
Timeline for prioritized data governance actions, focused on achieving quick wins and demonstrating value

TRANSFORMATION ROADMAP
Prioritized requirements and future needs to achieve the target state vision of Data Governance

Our Frameworks

Our in-house accelerators & frameworks can be leveraged to drive delivery excellence and accelerated value unlock

DATA MANAGEMENT FRAMEWORK

DATA MATURITY ASSESSMENT TOOL

DATA GOVERNANCE ASSESSMENT FRAMEWORK

DATA QUALITY ASSESSMENT FRAMEWORK

DATA GOVERNANCE BUSINESS OWNERSHIP PARADIGM

ORG. DESIGN DECISION FRAMEWORK

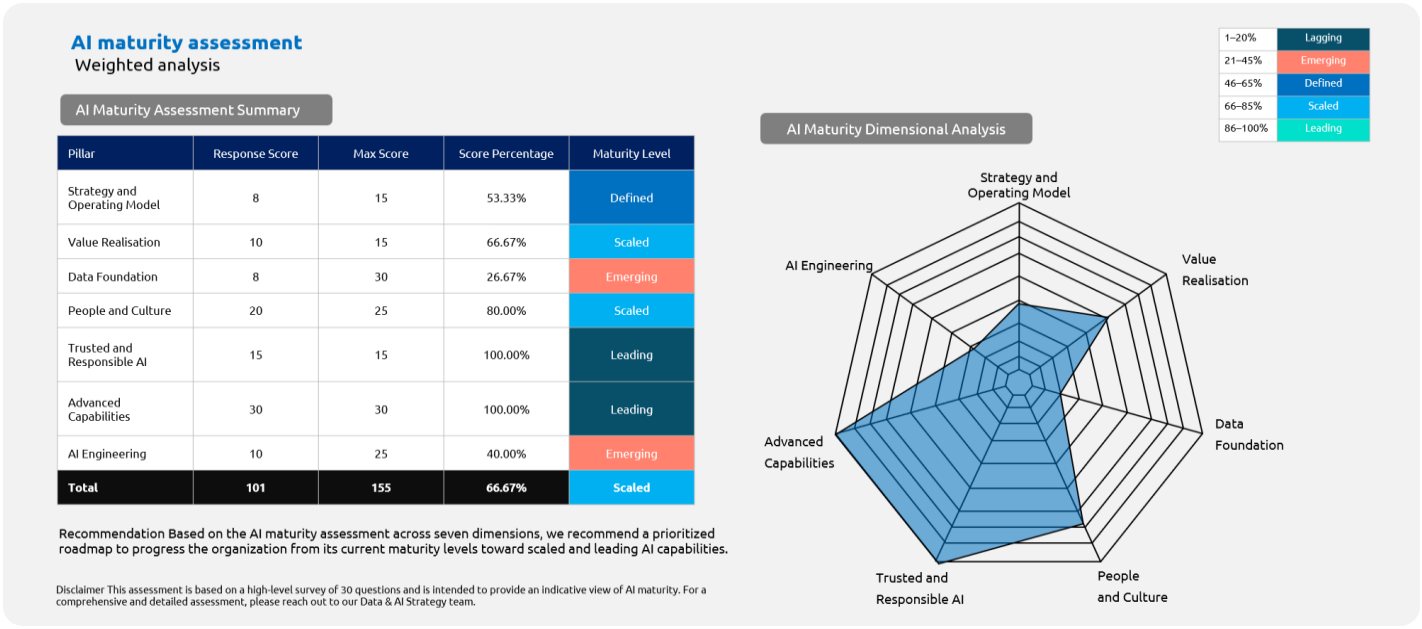

DIGITAL MATURITY ASSESSMENT FRAMEWORK – CAPGEMINI X MIT

GEN AI DATA FOUNDATION

AI Maturity Assessment Framework

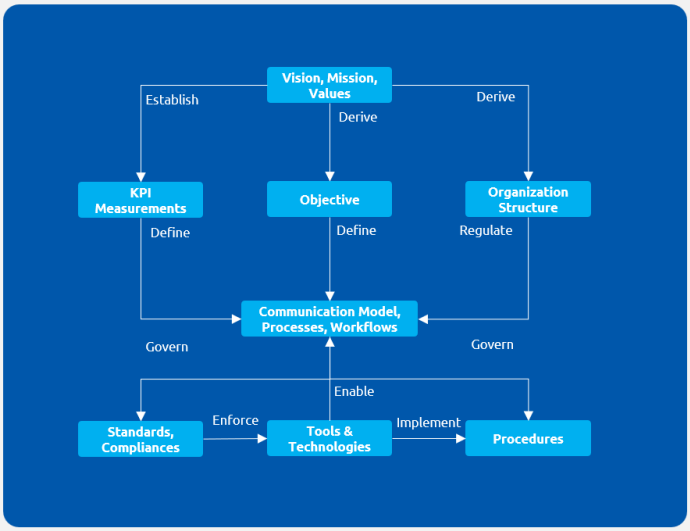

Sample Deliverables

Focus Areas	Current Maturity	Gaps
Organizational culture and mindset	Organized	▪ Gaps in alignment between Business Vision & Data Foundation ▪ Low Agile adoption at an organizational level ▪ Aspiring to Data Driven Decision Business Model ▪ Gaps in Data & AI Literacy Across the Business Units/Entities ▪ Missing Data Design Office for Effective Data Driven Culture ▪ Need an actionable ESG roadmap and ESG goals
Data management	Emerging	▪ 'Poor' Data Quality & Lack of data quality practices ▪ Need to set up a MDM platform for vendors, partners, products and end customers ▪ Product classification & recommendation not standardized across products and units ▪ Need for formal data governance processes and policies. Business ownership not established ▪ Talent crunch of Data/AI Professionals
Reporting and analytics	Organized	▪ Need to increase AI / ML adoption. Need to establish confidence on AI/ML models ▪ Need to integrate external competitor data gathered through web scraping for reporting ▪ Business Users Expect a Digital Data Platform & Self-Service Capabilities with real time reporting ▪ Potential AI & Analytics use cases initiated recently – Aim to increase reach and improve accuracy ▪ DevOps practice is nascent stage. Plan in place to mature it

Frameworks below are scoped to the data foundations CWS needs to enable its Digital & AI transformation and delivered as decision-ready artefacts, not a stand-alone enterprise data management programme.

Data Governance Operating Model

The below diagram depict the high-level responsibilities of DG, Steering Committee, Data Governance Squad and Business Departments, Technical Team and relevant stakeholders.

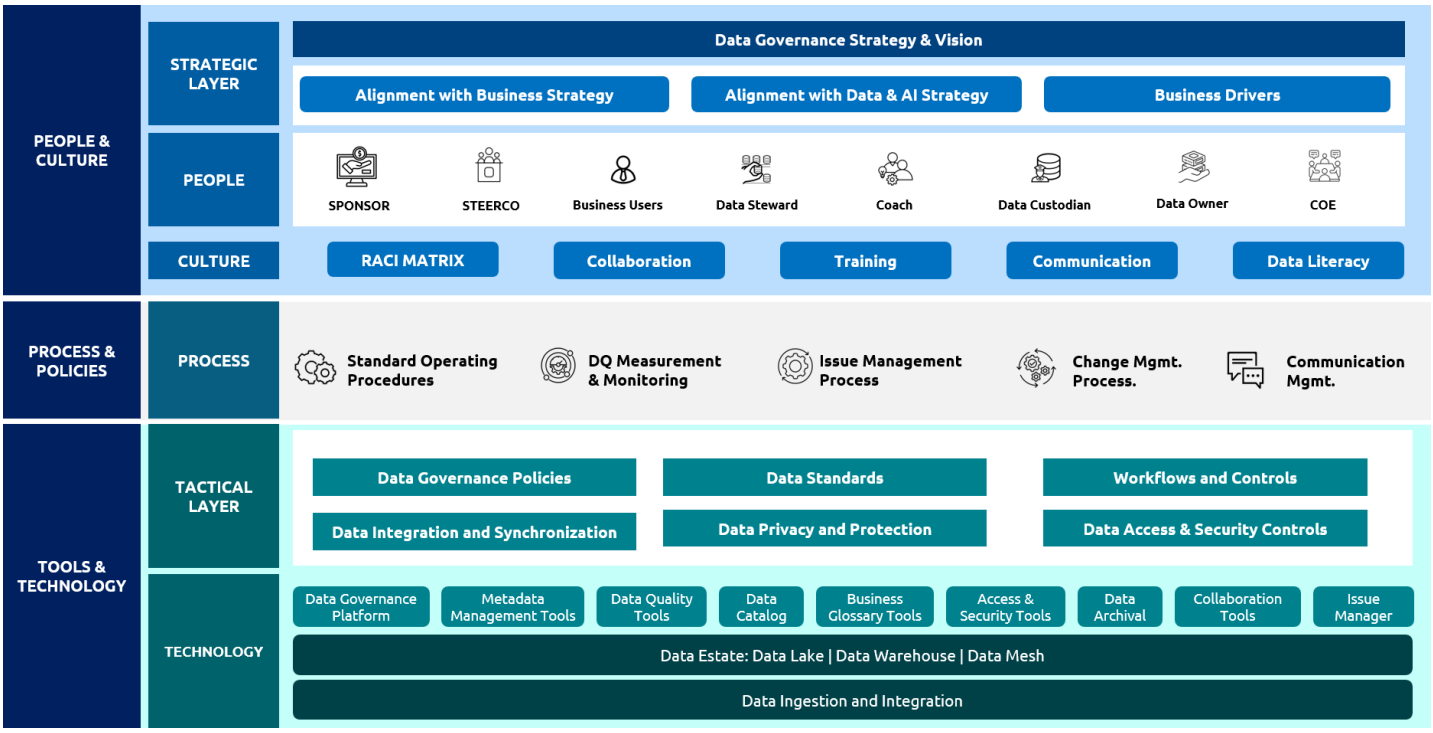

Target operating model target	Platform reference architecture data	Management design and set up

- Set Vision, Mission and Goals of Group Data Excellence Office
- Funding of the data office programs and establish DHA mandate to leverage data
- Track the returns on investments on data initiatives

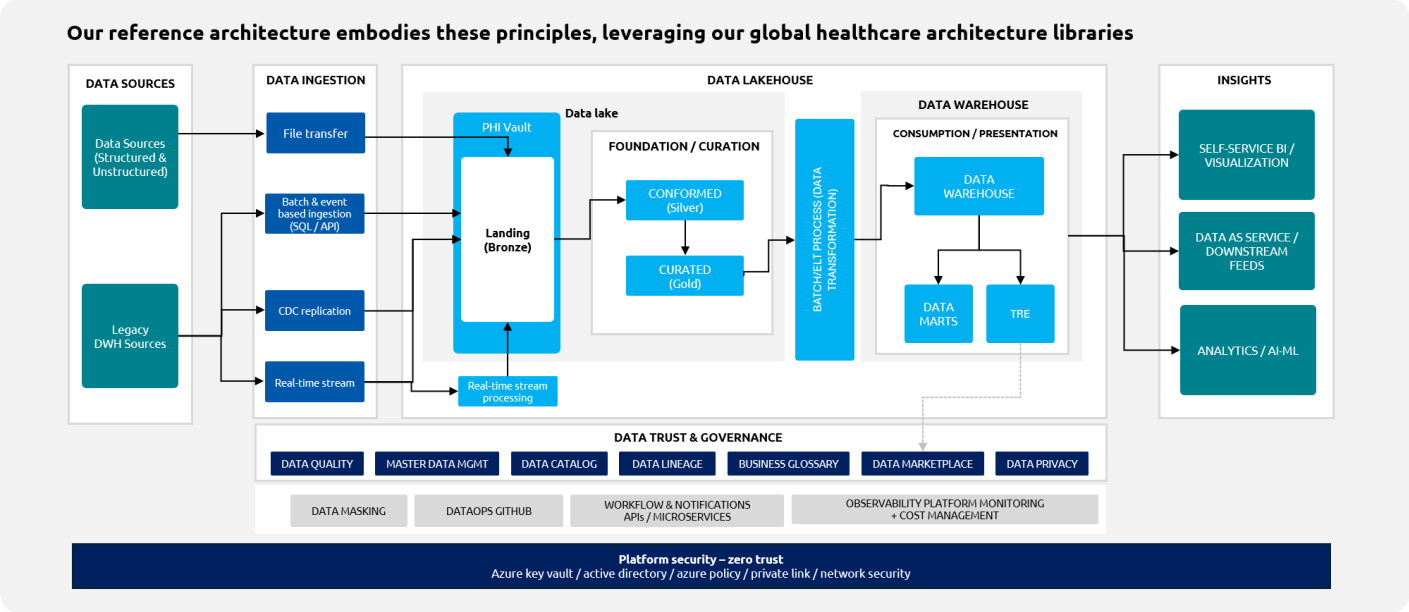

- Derive DEO Objective, KPI and establish Organization Structures following Enterprise Vision, Mission and Values
- Formulate Charter and secure budget, set up & authorize DEO
- Resolve conflicts, Escalation Management (Issues raised by DEO)

- Establish Health Data Governance Framework
- Define Health Data Governance Policies, Standards and Guidelines
- Ensure that data management practices adhere to regulatory requirements such as UAE PDPL Law and ICT Law.
- Ensure operationalization of DG operating model with roles & responsibilities as per defined framework
- Establish Health Data KPIs
- Oversees data quality initiatives, including data profiling, cleansing, and remediation efforts to maintain the accuracy and reliability of data assets
- Review KPIs to strengthen decision making process
- Provide guidance and clarifications on data governance to departments.
- Provide advisory to business partners and IT & support partners on operationalization of policies and procedures around areas of data management.
- Collaborate with Information Security Office to ensure appropriate due diligence of data protection.
- Conduct change impact assessments, update data governance policies, guidelines due to strategic business, technology transformation and regulatory initiatives.
- Provide training and awareness programs to educate employees about data governance policies, procedures, and best practice.
- Provide advisory to data owners to perform data classification.
- Prepare KPIs report in coordination with business and technical team and submit to Steering Committee for decision making.
- Audit, validate, and report results and practice compliance.

Data Governance Operating Model

Data Governance Framework

Target State Architecture

F. Domain 6 - Technology Architecture and Platforms

Understanding of the Engagement

CWS's transformation challenge is not the absence of technology, but the fragmentation of technology, data, workflows and decision-making across the enterprise. The current environment contains important strategic assets, including Cerillion, NI2, D365, LATRO, CEM, analytics capabilities, Power BI, the Bon Espoir Data Centre and Microsoft ecosystem investments. However, these assets do not yet operate as a coherent digital platform spine capable of supporting digitalization, process automation, customer-centricity, advanced analytics and enterprise AI at scale.

Domain 6 is therefore a foundational enabler for the total transformation programme. The objective is not to modernize applications in isolation, but to define a practical enterprise architecture that aligns business capabilities, application platforms, integration patterns, data assets, security controls and AI enablement around a common Digital Service Provider vision.

Our response is deliberately anchored to the CWS doctrine: *Data before AI*. Workflow before automation. Integration before scale. This means Domain 6 will be delivered as a strategy and advisory workstream. The focus is to validate the inherited technology baseline, define a conceptual target technology architecture, identify integration and platform priorities, and develop a practical 0–36 month technology roadmap. The outputs will provide executive-level architecture direction, sequencing guidance, governance recommendations, and roadmap-level decisions. Detailed solution architecture, API specifications, infrastructure engineering, vendor selection, product procurement, implementation planning, security audits, penetration testing, cloud migration planning and proof-of-concepts are outside the scope of this engagement..

1.1 Key Technology Transformation Drivers

Driver	Implication for Domain 6
DSP transition	Architecture must support CWS's shift from traditional telecom operations to a digital service provider model.
Cerillion-NI2 disconnect	Current customer, billing, network and service views require manual reconciliation and prevent end-to-end visibility.
D365 F&O programme	Target architecture must align to the planned D365 modernization and avoid competing data or process models.
Enterprise Data Platform	Technology architecture must provide integrated, governed and AI-ready data flows into the Domain 5 data foundation.
Customer 360 and Service 360	CWS needs a common customer-service-resource view across Cerillion, NI2, operational platforms and reporting.
Automation and AIOps	Automation must be based on structured workflows, reliable integration and monitored service events.
Cloud and security posture	Hybrid placement must balance Bon Espoir Data Centre, Azure, data classification, sovereignty and resilience.
Enterprise AI enablement	AI use cases require a sanctioned AI platform, trusted data, integration, model lifecycle controls and Responsible AI governance.

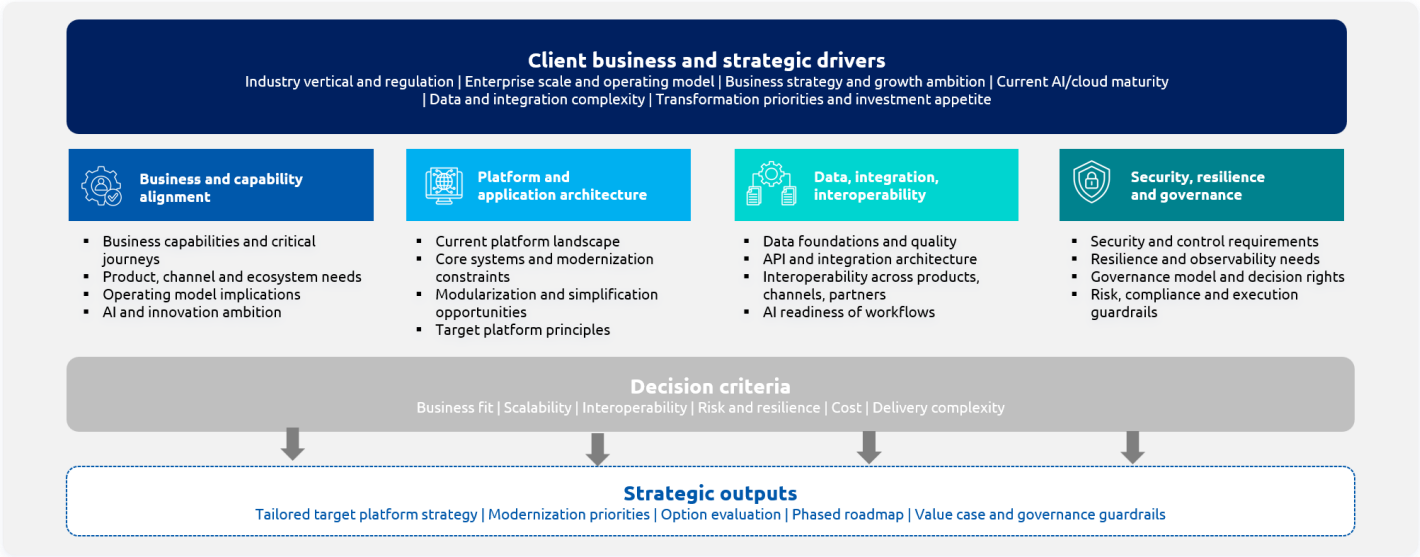

1.2 Mapping Six Systemic Failures to Architecture Response

Systemic Failure	Domain 6 Architecture Response
Data fragmentation	Enterprise data platform, canonical data model, MDM, metadata, lineage and governed reporting layer.
Unstructured data dependency	Document digitization patterns, knowledge management integration, metadata tagging and AI-ready content controls.
Email as workflow engine	Workflow platform, case management, process orchestration and SLA-driven operational workflows.
Lack of real-time visibility	Enterprise monitoring, observability, event management, service 360 dashboards and operational telemetry.
Cross-department bottlenecks	Shared workflow standards, integration services, process ownership and service-level handoff design.
Humans as integration layer	API-first and event-driven integration layer connecting Cerillion, NI2, D365, LATRO, CEM and ticketing systems.

1.3 Current-State Technology Maturity Heatmap

Assessment Area	Indicative Maturity	Priority Issue
Enterprise application landscape	Medium	Fragmented application ownership and overlapping functions across business and operational platforms.
OSS/BSS integration	Low	Cerillion-NI2 disconnect creates manual synchronization and limits service visibility.
Integration architecture	Low	Point-to-point and human-mediated integration patterns restrict scale and automation.
Data architecture alignment	Medium-Low	Data assets exist, but enterprise data model, lineage and trusted reporting need strengthening.
Workflow orchestration	Low	Email, spreadsheets and manual follow-ups continue to operate as workflow engines.
Cloud and infrastructure readiness	Medium	Bon Espoir and Azure can form a strong hybrid foundation, but workload placement and DR strategy need formalization.
Cybersecurity architecture	Medium	Security controls exist but Zero Trust, API security and AI security need enterprise design.
AI platform readiness	Low	AI potential is high, but scalable AI requires data, integration, governance and platform services first.
Technology governance	Medium-Low	Architecture decision rights, standards, integration governance and roadmap controls need to be institutionalized.

Our Enterprise Architecture Framework for Domain 6

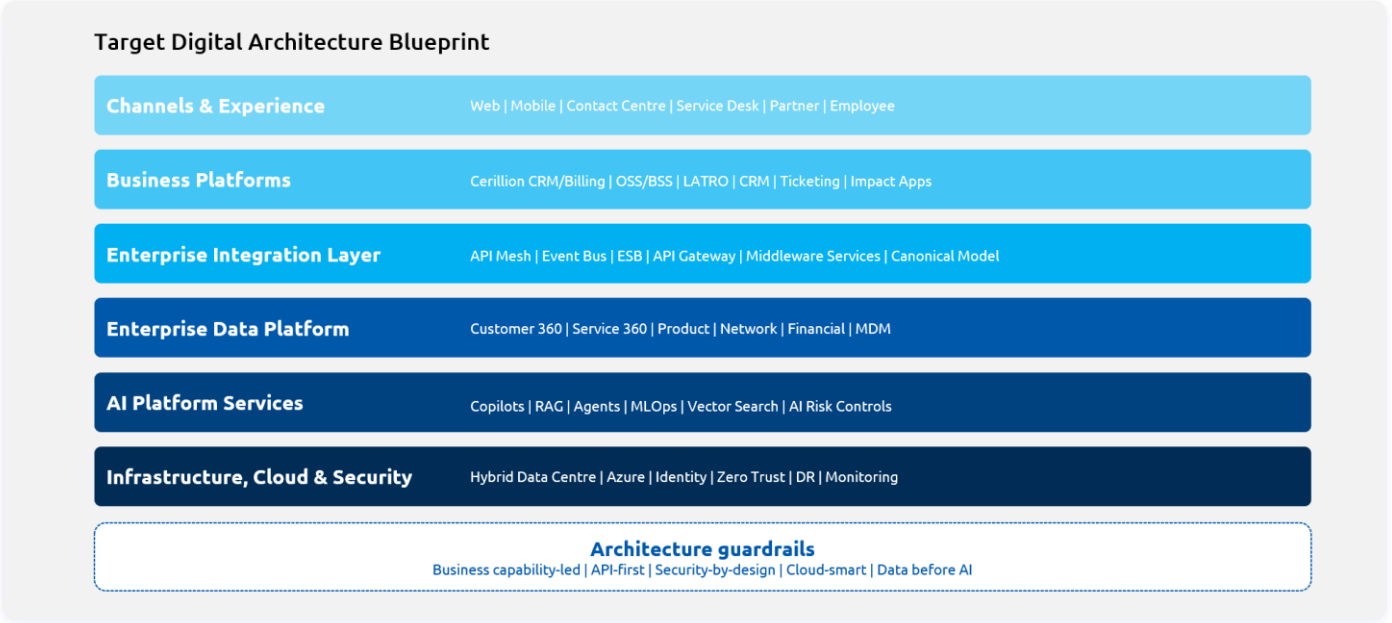

Our approach to designing the enterprise architecture is governed by a structured framework that explicitly aligns overarching strategic drivers with actionable technical outputs. Recognizing the ambition of CWS to transition into a true Digital Service Provider, this framework ensures that every architectural decision is fundamentally grounded in your current technology estate, existing integration complexities and the strict operational realities of the island telecommunications sector. By filtering transformation priorities through this structured lens, we guarantee an architecture that accelerates digital capabilities without jeopardizing mission-critical network resilience.

To translate this strategic ambition into a practical blueprint, the framework evaluates the enterprise through four interconnected pillars. The business capability and platform architecture pillars focus heavily on accommodating your inherited core systems and non-negotiable modernization constraints. Rather than proposing theoretical or highly disruptive system replacements, this structural evaluation establishes precise architectural boundaries. This ensures we design a target platform strategy that gracefully orchestrates workflows around the vendor-managed **Cerillion** billing platform while securely positioning the incoming **Microsoft Dynamics 365** implementation as the modernized financial core.

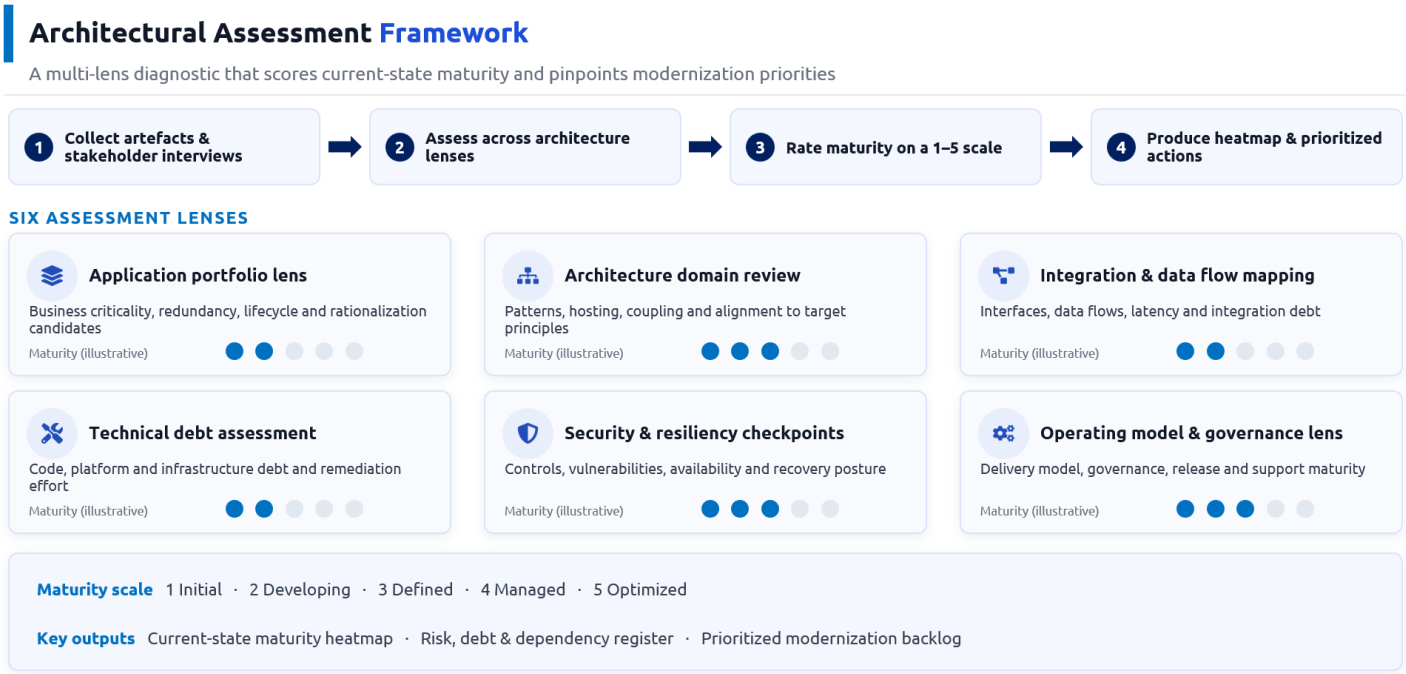

Simultaneously, the integration and security pillars of the framework serve to operationalize your foundational mandate of **Data before AI. Workflow before automation. Integration before scale.** This ensures the resulting API and integration architecture specifically resolves critical interoperability failures, such as the disconnect between the **Cerillion and NI2 platforms**, before attempting to layer intelligence on top of fragmented data. Furthermore, all security, resilience and governance assessments are strictly bound by your sanctioned environment with data classification posture. This guarantees that the target architecture natively protects regulated Tier 4 data within the Tier IV **Bon Espoir Data Centre**, while safely leveraging the **Microsoft Azure** ecosystem for scalable enterprise intelligence.

Ultimately, this framework filters all technical design options through rigorous decision criteria encompassing business fit, delivery complexity, interoperability and cost. This critical filtering process ensures that the strategic outputs delivered at the conclusion of Domain 6 are not merely conceptual diagrams. Instead, they form a highly pragmatic, phased modernization roadmap equipped with indicative value opportunities, operational governance guardrails and cloud-versus-on-premise placement guidance tailored specifically to the Seychelles operating environment.

Capgemini will adopt a business-led enterprise architecture approach that connects technology decisions directly to customer outcomes, operational efficiency, data-driven decision-making, workforce enablement, revenue growth and future AI capabilities. The approach uses proven enterprise architecture methods while tailoring them to CWS's telecom context, existing platforms and operational constraints.

2.1 Architecture Assessment Framework

To answer the core strategic question of Domain 6, we will deploy our Architectural Assessment Framework as the methodological engine to define the target digital architecture blueprint for CWS. Rather than initiating a redundant greenfield discovery, the first phase of this framework—artefact collection and stakeholder interviews—will directly ingest the eight completed departmental discoveries. By anchoring our assessment in your existing baseline, we accelerate the maturity rating process and immediately focus on sequencing the target architecture against inherited constraints, ensuring zero service disruption to core telecom operations.

The application portfolio and technical debt lenses of the framework will be strictly calibrated to accommodate the reality of the CWS legacy environment. We recognize that core platforms like Cerillion cannot be immediately replaced and overlapping ticketing applications require consolidation. By evaluating business criticality and remediation effort, these lenses will produce a pragmatic OSS/BSS modernization roadmap. This roadmap will gracefully wrap legacy systems while paving the way for the Microsoft Dynamics 365 Finance & Operations go-live in May 2027 and the ongoing LATRO revenue assurance implementations.

Addressing your most critical systemic integration gaps, the integration and data flow mapping lens will define the necessary middleware, event and API layers required to eliminate manual human integration. We will specifically target the disconnect between Cerillion and the NI2 network inventory system. By mapping these interfaces and latency requirements, we ensure that the architecture honors the integration before scale mandate, laying a structured data foundation before any advanced intelligence is layered on top.

Our architecture domain and security resiliency checkpoints will directly inform your cloud-versus-on-premise sequencing and AI platform tooling recommendations. Leveraging your existing assets, such as the Bon Espoir Data Centre and the Microsoft 365 ecosystem, we will map out hosting patterns that align with your strict regulatory environment. The security lens will strictly enforce the CWS posture of a sanctioned environment with data classification, ensuring that customer and regulated billing data remain technically isolated and that all AI-specific security protocols align with the Seychelles Data Protection Act.

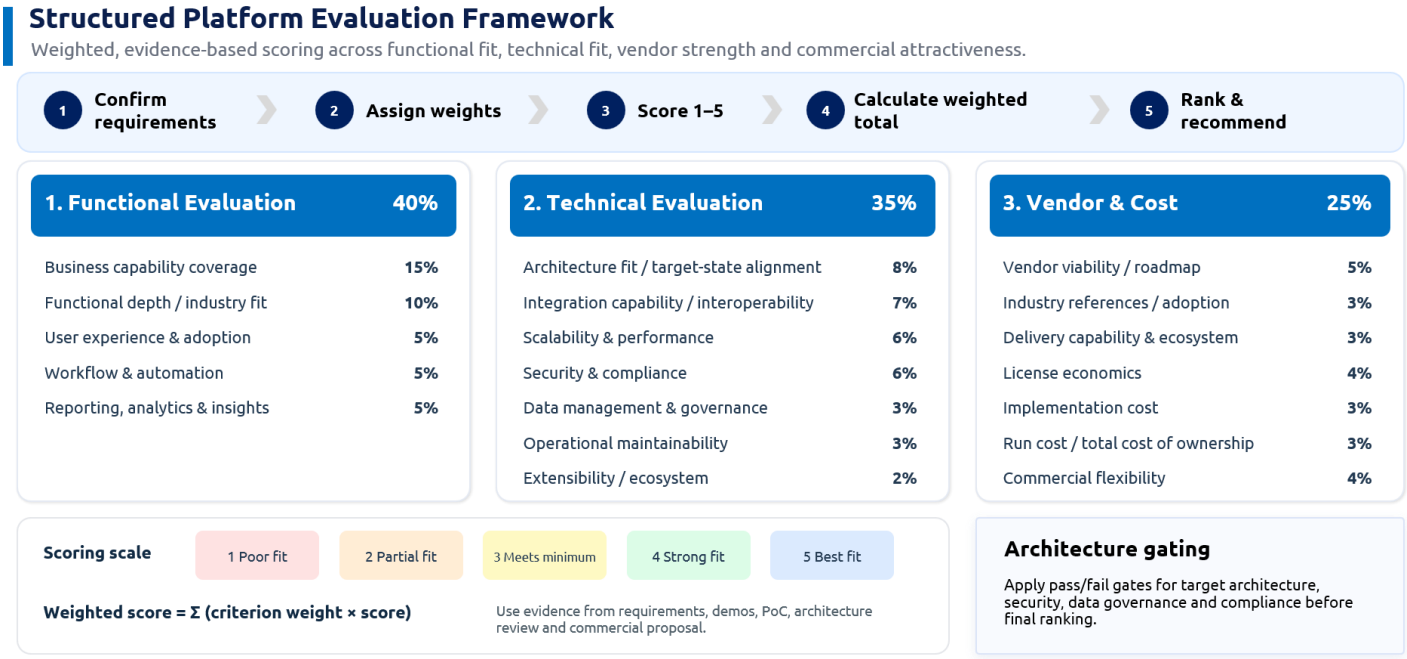

Finally, the operating model and governance lens will ensure the resulting modernization backlog is executable given the actual engineering capacity and physical geographic constraints of CWS. The outputs of this framework—comprising a current-state maturity heatmap, a dependency register and a prioritized modernization backlog—will translate directly into your phased implementation roadmap. This structured approach guarantees that architectural decisions are not made in a vacuum, but are intricately sequenced to support your transition to a fully realized DSP.

2.2 Architecture Design Principles

Principle	How it shapes the Domain 6 response
Data before AI	AI deployment will be sequenced only after trusted data, ownership, classification and quality foundations are in place.
Workflow before automation	Digital workflows will be defined before scaling automation or agentic operations.
Integration before scale	Reusable APIs and event-driven integration will precede enterprise-wide scaling of digital capabilities.
Business capability-led	Architecture decisions will be linked to business outcomes, not technology preference.
API-first and event-ready	New integrations will favor standard APIs, reusable services and event patterns over point-to-point coupling.

Cloud-smart, not cloud-only	Workload placement will consider data sensitivity, latency, resilience, cost, sovereignty and operational risk.
Security-by-design	Zero Trust, data protection, API security and AI security will be embedded into architecture decisions.
Reuse before replacement	Existing strategic investments will be optimized and integrated before recommending replacement.
Platform over point solution	Foundational capabilities will be treated as reusable enterprise platforms rather than isolated project tools.
Governed agility	Architecture governance will enable faster decisions while controlling risk, standards and interoperability.

2.3 Structured Platform Evaluation Framework

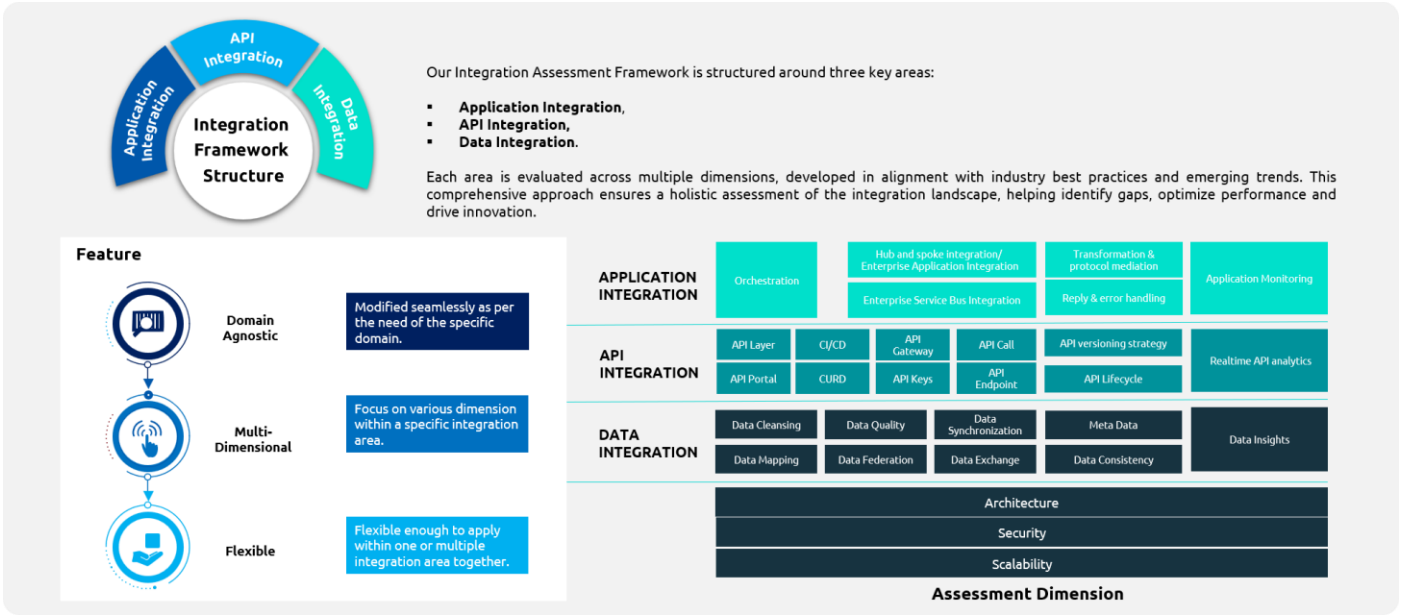

To support the vendor and technology assessment components of Domain 6, our Structured Platform Evaluation Framework provides the objective, evidence-based methodology required to inform your build-versus-buy decisions. As outlined in the RFP, we recognize that our role is strictly advisory and that CWS retains overall governance and final procurement authority. This framework will serve as the rigorous analytical engine we use to assess the external vendor landscape, specifically targeting the required technologies for your eleven-item platform spine, such as the Enterprise Data Platform and the integration middleware.

The most critical element of this framework for CWS is the preliminary architecture gating mechanism. Before any functional or commercial scoring takes place, every prospective platform or tool must pass strict, non-negotiable compliance gates. We will configure these gates to immediately disqualify any solution that violates your sanctioned environment with data classification posture, conflicts with the Seychelles Data Protection Act, or attempts to layer black-box intelligence without respecting the Data before AI sequencing mandate. This ensures that no platform advances to the scoring phase if it poses a risk to telecom service continuity or data sovereignty.

Once a platform passes the architecture gates, the functional and technical evaluations are carefully weighted to address your specific enterprise pathologies. The functional evaluation strongly emphasizes workflow and automation capabilities, ensuring new platforms actively replace the legacy reliance on email and Excel-based coordination. Concurrently, the technical evaluation prioritizes integration capability and interoperability. Any new solution must demonstrate the ability to seamlessly exchange data with your existing anchors, including Cerillion, NI2 and the incoming Microsoft Dynamics 365 ecosystem, thereby eliminating the need for human personnel to act as manual integration layers.

Finally, the platform option assessment criteria lens adapts the scoring to the unique geographic and commercial realities of CWS. By scrutinizing vendor viability, delivery ecosystem and total cost of ownership, we ensure that proposed platforms are sustainable within a small island economy possessing a limited local technical talent pool. This comprehensive scoring process guarantees that our final platform recommendations will structurally enable your transition to a DSP without deepening technical debt or vendor lock-in.

2.4 Our Integration Framework for Domain 6

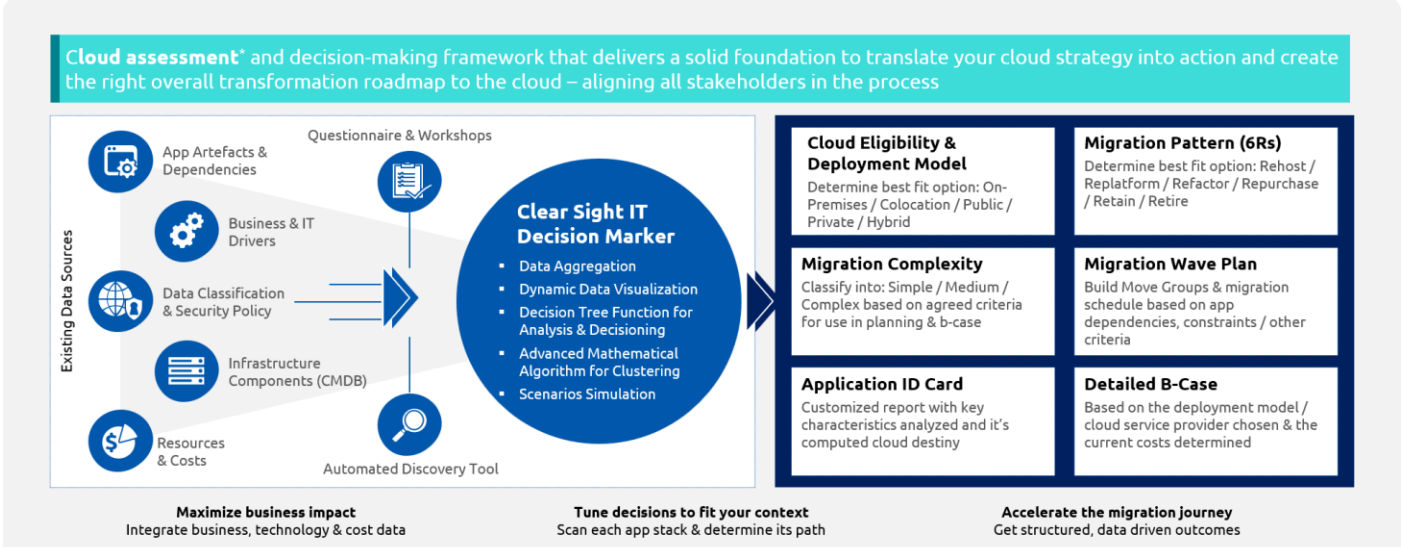

To directly address the critical enterprise pathology identified in your discoveries—specifically, humans functioning as the manual integration layer between systems—we will deploy our Integration Assessment Framework as the cornerstone of our Domain 6 response. Because CWS operates under the non-negotiable principle of integration before scale, this framework provides the structured, multi-dimensional approach required to untangle your fragmented landscape. By separating the integration strategy into three distinct but complementary areas—Application, API and Data Integration—we can design a target architecture that seamlessly connects your legacy environment without demanding the immediate replacement of mission-critical systems.

Through the Application Integration lens, we will address the immediate architectural anchors and systemic disconnects, most notably the gap between Cerillion and your NI2 network inventory system. Rather than proposing risky rip-and-replace strategies, our approach evaluates necessary orchestration, protocol mediation and enterprise service bus capabilities to bridge these legacy platforms. This ensures that essential telecom operations maintain zero service disruption while gracefully connecting to parallel modernization programs, such as the incoming Microsoft Dynamics 365 Finance & Operations environment and the active LATRO implementations.

Simultaneously, the API Integration dimension establishes the scalable digital nervous system required for your transition to a Digital Service Provider. By designing a robust API layer complete with gateway management, versioning strategies and real-time analytics, we shift your architecture away from point-to-point technical debt. This API-first posture directly supports your Track 1 quick wins within the Microsoft 365 ecosystem and provides the standardized endpoints necessary for future omnichannel customer experiences and AI chatbot deployments, ensuring agility without compromising central governance.

Finally, the Data Integration component acts as the enforcement mechanism for your Data before AI mandate. To resolve the enterprise failure of data fragmentation and unstructured data dependency, this layer focuses heavily on data cleansing, synchronization and federation. By establishing a single source of truth, this framework designs the pipelines needed to feed your foundational Enterprise Data Platform. Underpinned by strict security and architecture parameters that honor your sanctioned environment with data classification posture, this ensures that any data moving across your network is clean, compliant and fully prepped for advanced predictive intelligence.

2.5 Our Cloud Strategy Framework for Domain 6

To address the specific requirement for cloud-vs-on-premise sequencing within Domain 6, our Cloud Assessment and Decision-Making Framework provides the rigorous, data-driven methodology necessary to optimize your hosting strategy. Recognizing that CWS owns strategic infrastructure assets like the Bon Espoir Data Centre while simultaneously expanding its footprint within Microsoft Azure and the Microsoft 365 ecosystem, this framework prevents arbitrary cloud migrations. Instead, it systematically evaluates your application portfolio to determine the optimal deployment model—whether on-premises, public cloud, private cloud, or hybrid—ensuring that every workload is placed where it delivers the highest performance, cost-efficiency and regulatory compliance.

The assessment begins by ingesting your existing data sources, explicitly anchoring the evaluation to the CWS sanctioned environment with data classification posture. By overlaying your business and IT drivers with your strict four-tier security policy, we ensure that workloads handling Tier 4 regulated customer and billing data are routed only to environments with demonstrated technical isolation. Through collaborative workshops that honor our co-creation mandate, alongside our proprietary decision engine, we process these inputs through advanced scenario simulations. This aggregation of technical dependencies and compliance guardrails allows us to confidently classify migration complexity and assign a definitive cloud destiny for every system, from legacy network inventory to modern operational workflows.

The tangible outputs of this framework directly translate into an actionable transformation roadmap. We apply the 6Rs Migration Pattern (Rehost, Replatform, Refactor, Repurchase, Retain, Retire) to formulate a precise high-level workload placement roadmap that completely respects your core telecom uptime constraints. This ensures that legacy monoliths like Cerillion are handled safely, while concurrent initiatives like the Microsoft Dynamics 365 go-live in May 2027 are fully supported without infrastructure conflict.

2.6 Our Cybersecurity Framework for Domain 6

To ensure Cable & Wireless Seychelles (CWS) successfully transitions to a Digital Service Provider (DSP) without compromising mission-critical service continuity, our technology architecture blueprint integrates a comprehensive cybersecurity methodology. As illustrated in the accompanying framework, this begins with a targeted Maturity Assessment of CWS's current hybrid landscape. We evaluate the existing security posture across legacy platforms like Cerillion, the in-flight D365 Finance & Operations environment and the proprietary Bon Espoir Data Centre. By analysing gaps across people, process and technology, we establish a realistic baseline that outlines the exact actions required to safely support your new enterprise integration layer and advanced AI tooling.

Building upon this baseline, we partner with CWS leadership to develop a a cybersecurity alignment recommendations and governance considerations perfectly aligned with your core principle of Data before AI. Workflow before automation. Integration before scale. This customized operating model operationalizes CWS's strict AI governance posture and four-tier data classification scheme. It establishes robust oversight for highly regulated Tier 4 customer data, embedding AI-specific security guardrails aligned with the NIST AI RMF and ISO/IEC 42001. By redefining existing IT processes, we establish the explicit cybersecurity roles required to govern generative AI and newly automated operational workflows securely.

To execute this vision, we co-develop a Digital Security Transformation Program that sequences meticulously alongside your inherited baseline of 57 initiatives. This transformation plan ensures continuous security modernization with absolute zero disruption to telecom operations or parallel workstreams like LATRO Phase 2. Finally, our framework ensures strict Regulatory Compliance by mapping the requirements of the Seychelles Data Protection Act and telecommunications confidentiality obligations directly into the digital architecture. To future-proof CWS against anticipated local legislation, we evaluate prevailing reporting gaps and align compliance mechanisms with the EU AI Act as the de facto global standard.

By integrating this framework directly into our Domain 6 deliverables, we provide a unified architecture where security acts as a profound enabler for AI adoption, allowing CWS to confidently scale its digitalization efforts.

2.3 Reference Frameworks and Patterns

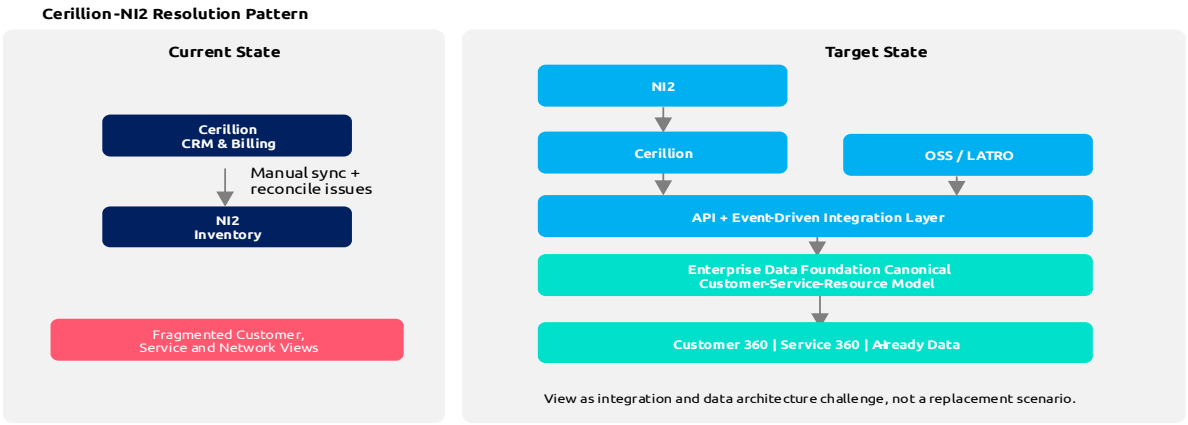

Domain 6 will combine telecom reference architectures, enterprise architecture methods and Microsoft cloud/security design guidance. These frameworks provide a common language for CWS, Capgemini, technology partners and future implementation teams.

Framework / Pattern	How Domain 6 will use it
TM Forum ODA	Reference blueprint for modular, cloud-native, open digital platforms for communications service providers.
TM Forum Open APIs	Standardized REST interfaces to reduce integration cost, accelerate interoperability and avoid vendor lock-in.
TM Forum eTOM/SID	Process and information model references for OSS/BSS modernization and customer-service-resource alignment.
TOGAF ADM	Enterprise architecture method for moving from baseline to target architecture and migration roadmap.
ArchiMate	Visual modelling language to represent business, application, data and technology relationships.
Microsoft Well-Architected Framework	Guidance for cloud workload reliability, security, cost optimization, operational excellence and performance.
Microsoft Zero Trust	Security strategy based on verify explicitly, least privilege access and assume breach.
NIST/ISO alignment for AI security	Controls to align AI platform security with Domain 9 risk and governance expectations.

Key Architecture Priorities

3.1 Priority 1 – Resolve the Cerillion-NI2 Challenge

One of the most significant architecture findings is the disconnect between Cerillion and NI2. Today, customer, service, billing, operational and network information is distributed across multiple platforms, requiring manual reconciliation and creating inconsistent reporting, limited service visibility and constraints on automation. Capgemini recommends addressing this as an enterprise integration and data architecture problem, not as a near-term replacement exercise.

3.2 Priority 2 – Validate and Optimize the Platform Spine

The CWS transformation portfolio is underpinned by an emerging platform spine. Domain 6 will validate whether these platforms operate as an integrated enterprise architecture rather than independent investments. The assessment will identify duplicated capabilities, fragile interfaces, integration gaps, sequencing constraints and opportunities to rationalize the landscape.

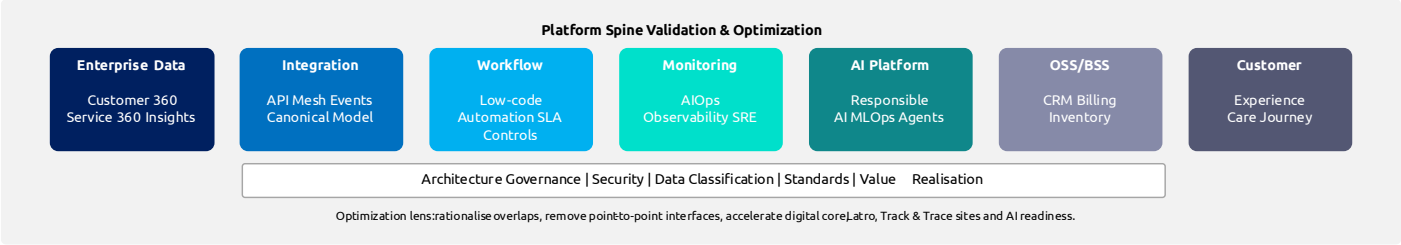

Figure 3. Platform spine validation and optimization pattern.

Platform Domain	Target Architecture Role
Enterprise Data Platform	Single trusted source for enterprise reporting, analytics and AI consumption.
Integration Platform	API gateway, event hub, reusable services and monitoring to eliminate point-to-point integration.
Workflow Platform	Orchestration of cross-functional workflows, case management and automation-ready processes.
Enterprise Monitoring Platform	Operational visibility, service health, telemetry, AIOps readiness and proactive incident management.
AI Platform	Reusable AI services, RAG, agent orchestration, prompt management, MLOps and governance controls.
Customer Platforms	Omnichannel engagement, Customer 360, personalization and service context sharing.
OSS/BSS Platforms	Integrated CRM, billing, inventory, fulfilment, assurance, revenue assurance and service management.
Analytics Platforms	Enterprise dashboards, predictive insights and value-realization monitoring.

3.3 Priority 3 – OSS/BSS Modernization Strategy

CWS's OSS/BSS modernization should maximize existing strategic investments while progressively moving toward an integrated Digital Service Provider architecture. Cerillion, NI2, LATRO, CEM, D365 and ticketing platforms should be connected through a governed integration and data foundation rather than treated as isolated replacement candidates.

Area	Modernization Focus
Customer and Commercial Systems	Maximize Cerillion value through integration, customer data quality, CRM automation and digital channel enablement.
BSS Capabilities	Strengthen product management, order management, billing, revenue assurance and commercial reporting.
OSS Capabilities	Improve inventory, fulfilment, assurance, network operations and service-resource traceability.
Revenue Assurance	Integrate LATRO insights into enterprise analytics, leakage prevention and revenue protection governance.
Service Management and Ticketing	Assess consolidation opportunities across Jira, ManageEngine and ServiceDesk environments to improve service visibility.
AIOps Foundation	Use CEM and monitoring data as inputs for predictive assurance, incident intelligence and operational automation.

Modernization Horizon	Focus
0-12 months – Stabilize & Integrate	Resolve critical integration gaps, validate D365/LATRO dependencies, improve data quality and reduce manual handoffs.
12-24 months – Digitize & Orchestrate	Introduce workflow orchestration, CRM automation, fulfilment process improvements and service management governance.
24-36 months – Intelligent Operations	Enable AIOps, predictive maintenance, intelligent assurance, AI-assisted operations and advanced analytics.
36+ months – Digital Service Provider Architecture	Evolve toward modular, composable, API-driven and AI-ready DSP platform architecture.

3.4 Priority 4 – Enterprise AI Platform Recommendations

AI should be treated as an enterprise capability rather than an isolated technology initiative. The AI platform recommendations will be aligned with Domain 9 governance and Domain 5 data foundations. Domain 6 will define the technical services, security controls and integration patterns required to deploy AI within sanctioned environments.

AI Architecture Layer	Capabilities
Layer 1 – Data Foundation	Enterprise data platform, MDM, metadata, quality controls, lineage and data classification.
Layer 2 – Integration Foundation	Secure connectivity to Cerillion, NI2, D365, LATRO, CEM, customer platforms, operational systems and knowledge repositories.
Layer 3 – AI Platform Services	LLM services, RAG, vector stores, AI agents, prompt management, evaluation, MLOps and model lifecycle management.
Layer 4 – Enterprise AI Solutions	Customer service copilots, knowledge management, churn prediction, predictive maintenance, AIOps and workforce assistants.
Layer 5 – Responsible AI & Governance	Risk tiering, human oversight, consent, auditability, explainability, AI incident response and vendor assessment controls.

3.5 Priority 5 – Cloud, Infrastructure and Security Strategy

The future-state architecture should support a secure, scalable and resilient hybrid operating model. Workload placement should be based on data sensitivity, availability, latency, operational risk, cost and regulatory considerations rather than a generic cloud-first position.

Workload Category	Indicative Placement / Design Guidance
Tier 4 regulated / highly sensitive data	Bon Espoir Data Centre or tightly controlled sanctioned environment with strict access, encryption and monitoring.
Core OSS/BSS operational workloads	Hybrid placement based on latency, vendor supportability, resilience and continuity requirements.
Enterprise reporting and analytics	Azure-aligned analytics patterns where data classification permits, integrated with enterprise data governance.
AI experimentation and copilots	Sanctioned Microsoft ecosystem services with approved data boundaries and Responsible AI controls.
Disaster recovery and resilience	Hybrid DR strategy with tested recovery objectives, backup immutability and operational runbooks.
Collaboration and knowledge management	Microsoft 365, SharePoint and Copilot within CWS tenant control and data handling policies.

Security Domain	Design Focus
Identity and Access Management	Microsoft Entra ID patterns, privileged access, MFA, RBAC, JIT/JEA and identity lifecycle integration.
Zero Trust Architecture	Verify explicitly, use least privilege access and assume breach as architecture design principles.
API Security	API gateway, authentication, authorization, throttling, audit logging and threat protection.
Data Protection	Data classification, encryption, key management, retention, masking and secure sharing patterns.
Cloud Security	Landing zone guardrails, network segmentation, policy control, workload protection and continuous compliance.
AI Security	Prompt injection controls, sensitive data protection, model access control, red-teaming and monitoring.
SOC/SIEM Integration	Centralized logging, monitoring, alerting, event correlation and incident response workflows.
Third-party Risk	Vendor security assessment, architecture review gates, access boundaries and data processing obligations.

Methodology and Workplan

Domain 6 will be delivered through four phases aligned to the overall 20-week engagement plan. The methodology is assessment-led, co-created with CWS stakeholders, and designed to produce executive-ready architecture recommendations, conceptual blueprints, governance guidance and roadmap-level sequencing rather than implementation-ready technical designs.

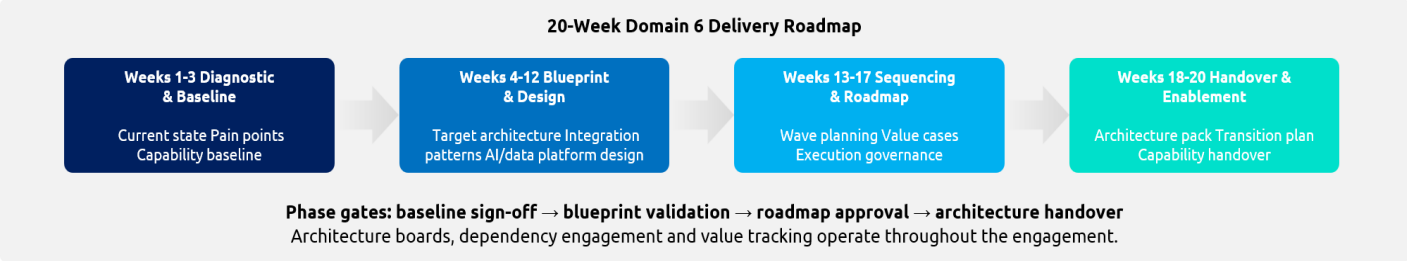

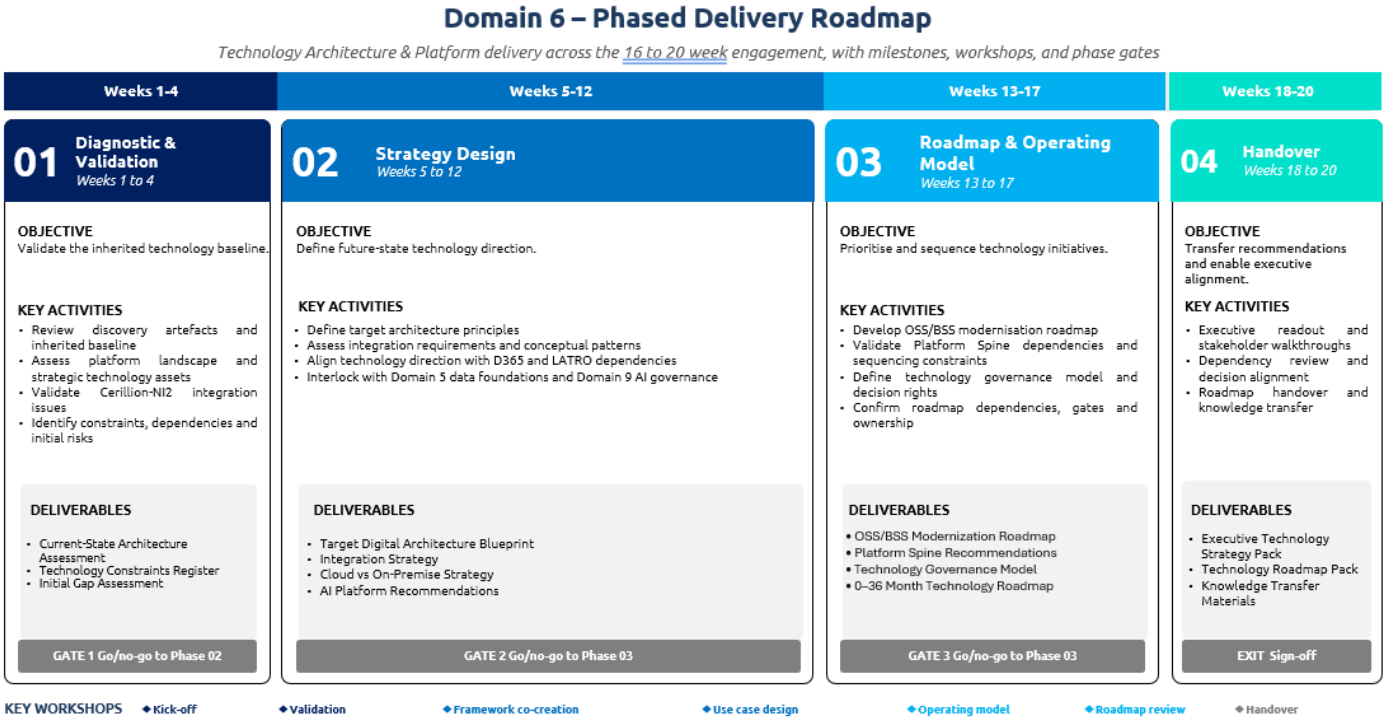

Figure 4. Domain 6 20-week workplan.

The methodology for Domain 6 directly aligns to the non-negotiable CWS strategic principle that dictates workflow and integration must precede automation and scale. To successfully transition CWS from a traditional operator to a Digital Service Provider, the proposed technology architecture will not simply layer AI over the existing fragmented infrastructure. Instead, our approach focuses on decoupling legacy systems, replacing manual integration with robust middleware and securely positioning the Microsoft ecosystem as the primary delivery vehicle for enterprise intelligence.

Workshops and Stakeholder Interactions

Workshop	Purpose
Architecture Baseline Workshop	Confirm current landscape, known constraints, business priorities and previous discovery findings.
Cerillion-NI2 Deep-Dive	Validate integration pain points, data ownership, interface gaps and priority use cases.
Platform Spine Workshop	Assess platform overlap, dependencies, maturity and sequencing across the transformation portfolio.
Cloud & Security Design Workshop	Validate workload placement, security controls, data classification and resilience expectations.
AI Platform Readiness Workshop	Align Domain 6 platform design with Domain 9 governance and Domain 5 data readiness.
Roadmap and Dependency Workshop	Validate sequencing, roadmap dependencies, phase gates, risks and implementation assumptions.

Technology Governance and Decision Model

Technology governance is a critical improvement area for Domain 6. Strong architecture governance will prevent new fragmentation, secure design decisions, manage dependencies and ensure that CWS technology investments become enterprise capabilities rather than isolated initiatives.

Governance Forum	Purpose	Cadence
Technology Steering Board	Prioritize transformation investments, resolve cross-domain decisions and approve strategic architecture direction.	Monthly
Architecture Review Board	Review target architecture, design decisions, standards, platform choices and change impacts.	Fortnightly
Integration Council	Govern API standards, interface reuse, event patterns, integration catalogue and service ownership.	Fortnightly
Data Governance Board	Owned by Domain 5, but interlocked to integration and data architecture decisions.	Monthly
AI Council	Owned by Domain 9, but interlocked to AI platform, sanctioned environment and deployment gates.	Monthly / as required
Security Design Authority	Approve security patterns, IAM, Zero Trust controls, API security, cloud guardrails and third-party risk exceptions.	Fortnightly
Value Realization Review	Track architecture-enabled outcomes, benefits, roadmap progress and dependency risks.	Monthly

5.1 Decision Rights and Architecture Controls

Decision Type	Recommended Owner / Governance Route
Architecture standards	Architecture Review Board with Technology Steering Board escalation for enterprise impact.
API and integration patterns	Integration Council with security approval for sensitive data interfaces.
Cloud workload placement	Architecture Review Board and Security Design Authority with business owner input.
AI platform usage	AI Council and Security Design Authority, aligned with Domain 9 risk tiering.
Data domains and ownership	Data Governance Board, aligned with Domain 5 data strategy.
Vendor/platform exceptions	Technology Steering Board with architecture, security and commercial review.
Roadmap sequencing changes	Technology Steering Board and Value Realization Review, based on dependency and benefit impact.

Key Deliverables and RFP Output Mapping

Deliverables below cover the architecture decisions needed to sequence CWS's Digital & AI transformation against D365, LATRO and Cerillion, delivered as blueprint-level documentation rather than detailed technical design.

Deliverable	Purpose	Key Contents	Output Format	Scope Boundary
Current-State Architecture Assessment	Validate technology baseline and architecture maturity	Platform inventory, maturity assessment, key constraints, architecture risks	Executive Deck (5 slides max)	Excludes technical audits, code reviews, infrastructure assessments
Technology Gap Analysis	Identify capability gaps impacting DSP transformation	Integration, workflow, cloud, security, AI readiness gaps	Executive Deck (5 slides max)	Excludes remediation planning and implementation design
Target Digital Architecture Blueprint	Define conceptual future-state architecture	Business, Application, Data, Integration, Security & AI views	Executive Deck (5 slides max)	Excludes HLD, LLD, network design and technical specifications
Cerillion-NI2 Integration Strategy	Address OSS/BSS interoperability challenges	Future-state interaction patterns, dependencies, integration principles	Executive Deck (4 slides max)	Excludes API design and middleware selection

Platform Spine Optimization Recommendations	Validate strategic alignment across platform investments	Gap analysis, overlap assessment, sequencing recommendations	Executive Deck (4 slides max)	Excludes platform rationalization execution
OSS/BSS Modernization Roadmap	Define modernization priorities and sequencing	Stabilize, Digitize, Intelligent Operations, DSP evolution	Executive Deck (5 slides max)	Excludes vendor selection and migration planning
Enterprise Data Architecture Alignment	Align technology architecture with Domain 5	Data flow principles, governance alignment, AI readiness	Executive Deck (3 slides max)	Excludes data modelling and migration design
Integration Strategy & Conceptual Integration Patterns	Define integration direction for enterprise platforms	API-first principles, event-driven patterns, integration governance	Executive Deck (4 slides max)	Excludes interface specifications and development activities
AI Platform Recommendations	Define AI platform enablement approach	AI capability layers, governance alignment, integration requirements	Executive Deck (5 slides max)	Excludes platform selection, model development and deployment
Cloud vs On-Premise Strategy	Recommend workload placement approach	Hosting strategy, resilience, sovereignty, cloud suitability	Executive Deck (4 slides max)	Excludes migration planning and infrastructure engineering
Cybersecurity Alignment Recommendations	Define target-state security posture	Zero Trust, API Security, Data Protection, AI Security	Executive Deck (5 slides max)	Excludes penetration testing and security implementation
Technology Governance Model	Establish architecture governance and decision rights	Governance forums, review processes, architecture controls	Executive Deck (4 slides max)	Excludes governance operations and policy creation
Technology Roadmap (0-36 Months)	Sequence technology transformation priorities	Dependencies, milestones, phase-based roadmap	Executive Deck (5 slides max)	Excludes project plans and resource planning

All Domain 6 outputs are advisory and strategy-oriented. They are intended to define the future-state technology vision, architecture principles, integration approach, platform sequencing, governance mechanisms and roadmap required to support the CWS Digitalization & AI Strategy.

The outputs will support executive decision-making and future implementation planning, but they are not intended to serve as detailed solution designs, technical specifications, procurement documents, implementation plans or deployment artefacts

6.1 RFP Expected Output Mapping

RFP Requirement	Delivered Through
Target architecture	Target Architecture Blueprint, Technology Gap Analysis and conceptual future-state architecture views.
OSS/BSS modernization	OSS/BSS Modernization Roadmap, Cerillion-NI2 Integration Strategy and platform spine assessment.
Integration layer	Integration Strategy, conceptual integration patterns, API-first principles and integration governance recommendations.
Cloud strategy	Cloud vs On-Premise Strategy, workload placement guidance and resilience considerations.
AI platform strategy	AI Platform Recommendations aligned with Domain 5 data foundations and Domain 9 AI governance.
Cybersecurity	Cybersecurity Alignment Recommendations covering Zero Trust principles, API security, cloud security, data protection and AI security considerations.

Value Realization and Expected Outcomes

The value of Domain 6 will be realized through improved integration, reduced manual intervention, trusted data, operational visibility, secure scalability and AI readiness. The roadmap will include leading and lagging indicators so architecture decisions remain linked to measurable outcomes.

Value Driver	Business Outcome
Integration and manual effort reduction	Reduction in manual reconciliation between Cerillion, NI2, D365, LATRO and ticketing systems.
Customer 360 and Service 360	Improved visibility of customer, product, service, inventory, ticket and network relationships.
Operational efficiency	Faster provisioning and assurance workflows through structured orchestration and reusable integration.
Data trust and reporting quality	Single trusted view for business reporting, analytics and regulatory/control reporting.
Automation readiness	Workflow and integration foundations that make RPA, AI agents and AIOps safer and more scalable.
AI readiness	Trusted data, sanctioned platform services, model lifecycle controls and secure AI integration.
Cyber resilience	Improved security posture through Zero Trust, API security, cloud controls and monitoring.
Modernization risk reduction	Phased roadmap that avoids disruptive replacement while increasing agility and interoperability.

7.1 Proposed Success Measures

Dimension	Indicative KPI
Architecture	Percentage of strategic initiatives mapped to Target Digital Architecture Blueprint, Technology Gap Analysis and conceptual future-state architecture views; exceptions reviewed and approved.
Integration	Number of reusable APIs/events; reduction in manual handoffs; usage of integration catalogue.
Data	Critical data domains with owner, lineage and quality controls; Customer 360 and Service 360 availability.
Operations	Reduction in workflow cycle time; improved incident visibility; fewer handoff escalations.
Cloud/Security	Workloads classified with placement decision; critical controls implemented; security exceptions reduced.
AI	AI use cases with data readiness assessment, risk tier, platform pattern and deployment controls defined.
Value	Technology roadmap initiatives linked to benefits, KPI owners and monthly value review cadence.

Why Capgemini for Domain 6

Differentiator	Value to CWS
Telecom architecture experience	Ability to combine OSS/BSS, integration, data, AI and security architecture into an executable DSP roadmap.
Architecture and transformation balance	Focus on pragmatic modernization that maximizes existing investments rather than disruptive replacement.
Integration-first method	Specific treatment of Cerillion-NI2 as integration and data architecture challenge with clear deliverables.
AI-ready but governed	AI platform blueprint aligned with data readiness, responsible AI controls and sanctioned environments.
Microsoft ecosystem alignment	Ability to leverage D365, Azure, Microsoft 365, Power Platform and Copilot where appropriate and compliant.
Reusable accelerators	Assessment frameworks, maturity heatmaps, architecture principles, Open API patterns, governance templates and roadmap methods.
Handover mindset	Architecture artefacts, decision models and operating controls designed for CWS ownership after the engagement.

Through Domain 6, CWS will establish the integrated technology architecture required to transform fragmented systems into a connected digital ecosystem. The resulting architecture will provide the foundation for customer-centric operations, automated workflows, trusted data, advanced analytics and enterprise-scale AI adoption while maximizing existing investments and reducing technology complexity.

G. Domain 7 - Operational Efficiency and Automation

All deliverables in this domain are scoped to the automation and workflow opportunities within CWS's inherited 57-item catalogue and delivered as prioritisation and design artefacts, not detailed process re-engineering documentation.

1. Executive Summary

CWS is operating in an increasingly competitive telecommunications landscape where operational efficiency, service quality, and customer experience are critical differentiators. As CWS evolves toward its Digital Service Provider vision, opportunities exist to modernize workflows, reduce operational complexity, and improve coordination across business and technology functions. Building on the existing portfolio of 59 identified initiatives, Capgemini will help CWS validate, assess, and prioritize opportunities that deliver measurable business value while aligning with ongoing transformation programs such as D365 Finance & Operations and LATRO Phase 2. Our approach focuses on workflow modernization as the foundation for automation, supported by governance, value realization, and future AI enablement. The result will be a practical, evidence-based roadmap that enables CWS to improve operational performance, reduce cost-to-serve, enhance customer service outcomes, and accelerate its transition to a digitally enabled telecom operator.

1.1 Our Understanding

CWS's own sequencing principle, "Data before AI. Workflow before automation. Integration before scale," is Domain 7's brief applied to operations. This is not a case for automation or AI in the abstract; it is a validated, evidenced sequence: which of the 59 initiatives move first, which need workflow redesign before they can be automated at all, and which depend on an AIOps capability, built from CWS's existing CEM platform, that does not yet exist in mature form. Our methodology enforces that order rather than skipping ahead.

1.2 In Scope

CWS should validate and sequence its existing 59-initiative baseline through a staged assessment funnel, not commission new discovery. We adapt Capgemini's Idea-to-Robot model to an assess-only mode: Identify, Qualify, and Prioritize run in this engagement and produce the enterprise automation heatmap. The same discipline extends to field operations, governance, and a forecasted, range-based financial case. Design & Develop and Deploy & Maintain are shown for continuity only and sit outside this engagement.

These reuses evidence already gathered: eight departmental discoveries and 59 initiatives, 30 quick wins and 29 structural. Our role is one consistent qualification and prioritization lens across all 59, not fresh interviews.

1.3 Out of Scope

We will not design, build, test, or deploy any automation; select or configure any field service platform; create or replace any governance body; or commit CWS to vendor costs or investment decisions. The deliverable across all four workstreams is a prioritized, evidence-based business case, not software, a selected platform, a new authority, or guaranteed savings. Implementation, budget, and vendor selection remain entirely with CWS.

1.4 Our Approach

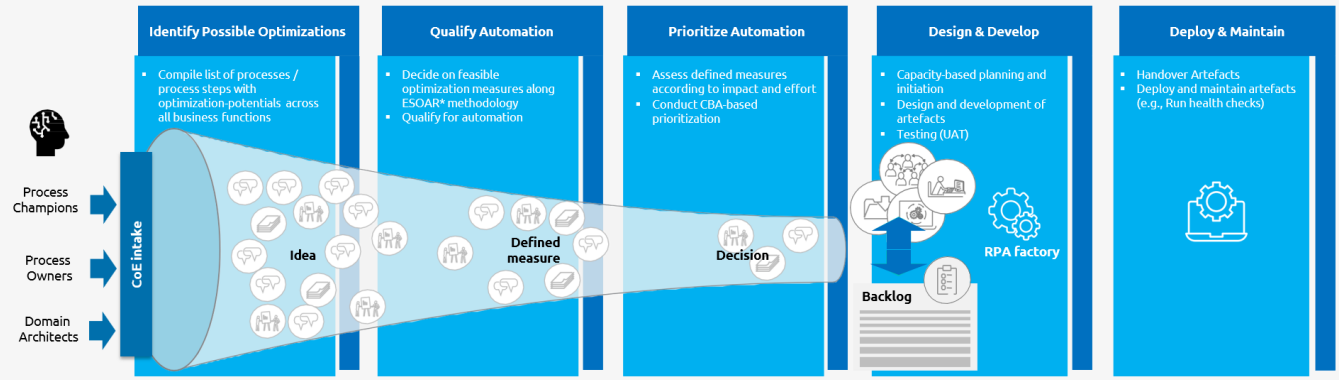

Each Domain 7 deliverable sits at a specific point on the narrative ladder:

- **Manual Processes:** How things run today, per Annexure A. Frontline teams rely on email and spreadsheets to manage work, data sits in disconnected systems, and no one has real-time visibility into what's happening.
- **Digital Workflows:** Our Methodology – Idea to robot Model turn the 59-initiative catalogue and field operations into a sequenced, prioritized, workflow-managed portfolio.
- **Intelligent Automation:** An AI-driven operations model, built by evolving CWS's existing CEM platform, not adding a separate AI system on top of manual processes.
- **Operational Excellence:** Governance and value realization keep everything accountable and show the improvement is real.

This document covers all four Domain 7 deliverables in full: the automation opportunity assessment , Automation Governance Framework, and Value Realization Financial Projections. The AI-Driven Operations Model, including AIOps evolution from the CEM foundation, sits on the same ladder and is covered today in the accompanying Domain 7 presentation; it can be added here at the same depth on request.

3. Methodology - Field operations optimisation assessment: An Assess-Only Adaptation of the Idea-to-Robot Model

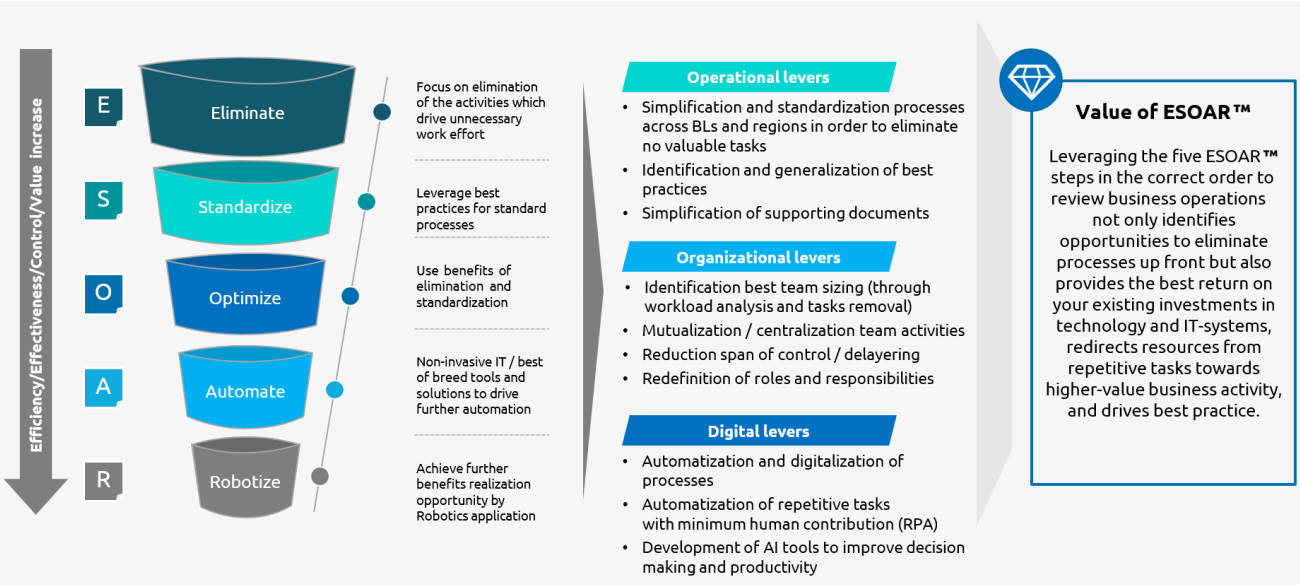

Capgemini will leverage its proven **Idea-to-Robot** methodology, adapted specifically for this strategic advisory engagement. As CWS has already identified 59 initiatives across multiple business functions, the focus is not on generating additional opportunities, but on validating, assessing, and prioritizing the existing portfolio using a consistent enterprise-wide framework.

The methodology follows three core stages—**Identify, Qualify, and Prioritize**—to evaluate business value, automation potential, implementation readiness, dependencies, and alignment with ongoing transformation initiatives. This ensures opportunities are assessed consistently and sequenced according to the principle of **workflow modernization before automation and automation before AI**.

The outcome of this assessment will be an enterprise automation heatmap, implementation roadmap, governance recommendations, and value realization projections that enable CWS to make informed investment decisions. While the full Idea-to-Robot lifecycle extends through solution design, development, deployment, and support, those stages remain outside the scope of this engagement and are included only to provide continuity into future implementation phases.

Stage	Purpose	Outcome
Identify	Consolidate and validate the existing 59 initiatives	Enterprise Opportunity Register
Qualify	Assess feasibility, readiness, dependencies and automation potential	Qualified Opportunity Portfolio
Prioritize	Rank initiatives based on value, complexity and strategic alignment	Enterprise Automation Heatmap & Roadmap
Design & develop	Detailed solution design and build	Out of Scope
Deploy & maintain	Deployment, support and continuous improvement	Out of Scope

4. Assessment Stages in Detail

This assessment is designed to validate, qualify, and prioritize CWS's existing portfolio of 59 initiatives through a structured and evidence-based approach. The objective is to create a clear enterprise-wide roadmap that identifies the highest-value opportunities, their dependencies, and the sequence in which they should be pursued. The assessment follows three stages—**Identify, Qualify, and Prioritize**—each building on the outputs of the previous stage to ensure consistency, transparency, and alignment with CWS's transformation objectives.

4.1 Consolidate and Identify

Objective: Establish a single, validated view of all automation and operational improvement opportunities identified by CWS.

Approach:

- Review and validate the existing 59-initiative portfolio and supporting discovery outputs.
- Consolidate opportunities into a centralized enterprise opportunity register.
- Standardize initiative descriptions, ownership, business objectives, and classifications.
- Assess completeness and identify any overlaps, dependencies, or gaps.
- Validate the consolidated opportunity register with business stakeholders.

Deliverables:

- Enterprise Opportunity Register - Consolidated inventory of automation, workflow modernization, digitalization, and AI-enabled opportunities identified through stakeholder engagements, existing assessments, and strategic discovery activities.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes opportunity inventory, categorization, strategic themes, and summary observations
- **Scope Boundaries**
  - Includes enterprise-level opportunity identification and classification.
  - Excludes detailed process assessments, process documentation, automation design, requirements gathering, and implementation planning.
- **Opportunity Classification Matrix -** Framework for classifying automation and AI opportunities based on value potential, complexity, feasibility, business impact, and strategic alignment with CWS's transformation objectives.
- **Output Format**
  - Executive presentation deck
  - Upto 3 slides/pages
  - Includes classification framework, categorization model, and assessment criteria
- **Scope Boundaries**
  - Includes strategic classification and prioritization methodology.
  - Excludes detailed scoring models, financial validation, technology assessments, and implementation readiness reviews.
- **Initiative Dependency & Gap Assessment -** Assessment of key business, process, data, technology, governance, and capability dependencies that may influence the successful adoption of automation and AI initiatives across the enterprise.
- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes dependency mapping, readiness observations, constraints, and recommendations
- **Scope Boundaries**
  - Includes high-level dependency assessment.
  - Excludes technical due diligence, detailed architecture reviews, operational readiness assessments, and remediation planning.

4.2 Qualify

Objective: Evaluate each initiative using a consistent framework to determine business value, automation suitability, readiness, and implementation dependencies.

Approach:

- Apply the ESOAR framework to identify opportunities for simplification, standardization, and workflow modernization before automation.
- Assess process characteristics, volumes, complexity, data quality, and exception handling.
- Evaluate business value, operational impact, risks, and dependencies.
- Review alignment with ongoing transformation initiatives, including D365 Finance & Operations and LATRO Phase 2.
- Document findings using standardized automation assessment templates.

Deliverables:

- Automation Potential Assessments - Strategic assessment of selected business domains and processes to identify potential opportunities for workflow optimization, automation, AI enablement, and productivity improvements.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes automation opportunity areas, indicative value potential, and prioritization recommendations
- **Scope Boundaries**
  - Includes high-level opportunity assessment and indicative automation potential.
  - Excludes process mining, time-and-motion studies, detailed process mapping, solution design, and automation feasibility studies.
- **CPAR (Current Process & Automation Requirements) Records -** High-level documentation of current-state process observations, automation opportunities, business objectives, and indicative automation requirements for shortlisted initiatives.
- **Output Format**
  - Executive presentation deck
  - Upto 3 slides/pages

- Includes summary process observations, opportunity statements, and high-level requirements

- **Scope Boundaries**
  - Includes strategic-level process and opportunity documentation.
  - Excludes business requirements specifications, functional requirements, user stories, process redesign, and implementation requirements documentation.
- **Qualified Opportunity Portfolio -** Prioritized portfolio of qualified automation, workflow modernization, and AI opportunities aligned to business objectives, transformation priorities, and value realization potential.
- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes prioritized opportunities, value categories, complexity indicators, and strategic recommendations
- **Scope Boundaries**
  - Includes enterprise-level opportunity prioritization.
  - Excludes solution evaluations, technology selection, vendor assessments, and implementation planning.
- **Workflow Modernization Recommendations -** Strategic recommendations for improving workflow efficiency, process orchestration, employee productivity, and customer outcomes through digitalization, automation, and AI adoption.
- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes modernization themes, capability recommendations, and improvement opportunities
- **Scope Boundaries**
  - Includes high-level workflow modernization recommendations.
  - Excludes business process re-engineering, detailed process redesign, workflow configuration, and implementation activities.

CPAR (Current Process & Automation Requirements Document): a standardized record of current-state characteristics, feasibility, dependencies, risks, and value drivers, the evidence base for prioritization and business case development.

4.3 Prioritize and Sequence

Objective: Prioritize opportunities based on business value, complexity, readiness, and strategic alignment to create an enterprise implementation roadmap.

Approach:

- Evaluate initiatives using Capgemini's SPACE prioritization framework.
- Assess value against feasibility, effort, risk, and organizational readiness.
- Develop an enterprise-wide view of the opportunity portfolio.
- Group initiatives into implementation waves based on expected value and dependencies.
- Validate priorities and sequencing with business and governance stakeholders.

Deliverables:

- Enterprise Automation Heatmap - Enterprise-wide view of automation and AI opportunities across business functions, illustrating opportunity concentration, readiness levels, implementation dependencies, and indicative value potential.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes heatmap visualization, opportunity clusters, readiness assessment, and value opportunities
- **Scope Boundaries**
  - Includes strategic opportunity mapping and prioritization.
  - Excludes opportunity implementation plans, solution designs, technical assessments, and process-level automation analysis.
- **Prioritized Opportunity Portfolio - C**onsolidated portfolio of prioritized automation, workflow modernization, and AI initiatives ranked according to business value, feasibility, readiness, risk, and strategic alignment.
- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes portfolio prioritization, value rankings, dependency considerations, and recommended sequencing
- **Scope Boundaries**
  - Includes prioritization recommendations and strategic portfolio view.
  - Excludes investment approvals, business-case sign-off, implementation plans, and procurement activities.
- **Wave-Based Roadmap -** Phased roadmap outlining the recommended sequencing of automation and AI initiatives across short-, medium-, and long-term implementation horizons.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes roadmap, priority waves, dependencies, and implementation guidance
- **Scope Boundaries**
  - Includes strategic sequencing and roadmap recommendations.
  - Excludes project planning, delivery schedules, resource planning, and execution management.

- **Investment and Value Prioritization View -** High-level assessment of anticipated business benefits, investment considerations, implementation complexity, and value potential across prioritized opportunities.
- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes value categories, investment considerations, prioritization matrix, and recommendations
- **Scope Boundaries**
  - Includes indicative value assessment and prioritization guidance.
  - Excludes detailed financial modelling, funding approvals, budget planning, and investment governance processes.

5 Assets and Accelerators by Stage

Capgemini will leverage a set of proven methodologies, templates, and accelerators developed through prior automation, workflow modernization, and transformation engagements. These assets enable a structured and consistent assessment approach, reduce stakeholder effort, and accelerate the delivery of actionable outcomes.

Assessment Stage	Asset/Accelerator	Purpose
Consolidate and identify	Opportunity Register Accelerator	Creates a centralized repository for all identified opportunities and supporting information
	Initiative Catalogue Framework	Standardizes opportunity descriptions, ownership, categorization, and business objectives
Qualify	ESOAR methodology	Identifies opportunities for elimination, simplification, standardization, optimization, and automation before recommending automation
	Automation Potential Assessment Document	Evaluates automation suitability, process complexity, business value, and implementation readiness
	CPAR reference example	Captures current-state process characteristics, dependencies, risks, and automation requirements
	AI & Automation Maturity Assessment	Assesses organizational readiness and enabling capabilities for future automation and AI adoption
Prioritize and sequence	SPACE scoring template	Prioritizing opportunities based on strategic value, feasibility, complexity, and expected benefits
	Use case prioritization matrix accelerator	Supports wave planning and roadmap development through value-versus-effort analysis
	Value Realization Assessment Model	Establishes projected business benefits, investment assumptions, and benefit tracking mechanisms

In addition, Capgemini will utilize proven artefacts such as Use Case Intake Forms, Opportunity Catalogues, As-Is Process Assessment Templates, Benefit Assessment Sheets, and Governance Framework Models to ensure a consistent and evidence-based evaluation across all initiatives.

These assets have been leveraged across multiple transformation and automation engagements to accelerate assessment activities, improve decision-making, and provide a robust foundation for roadmap development and future implementation planning.

Opportunity Sequencing Framework

Wave	Focus	Typical Characteristics
Wave 1 – Quick Wins	High-value, high-readiness opportunities	Minimal dependencies, rapid realization of benefits
Wave 2 – Workflow & Process Automation	Opportunities requiring process redesign or cross-functional alignment	Moderate complexity and dependency management
Wave 3 – Intelligent Automation & AI Enablement	Opportunities dependent on enhanced data, integration, or platform maturity	Higher complexity with strategic long-term value

The heatmap will provide CWS with a clear view of what to automate, when to automate, and what foundational capabilities must be established beforehand. It will also form the basis for the Automation Governance Framework and Value Realization Model, enabling future investment decisions to be supported by a consistent, evidence-based prioritization approach.

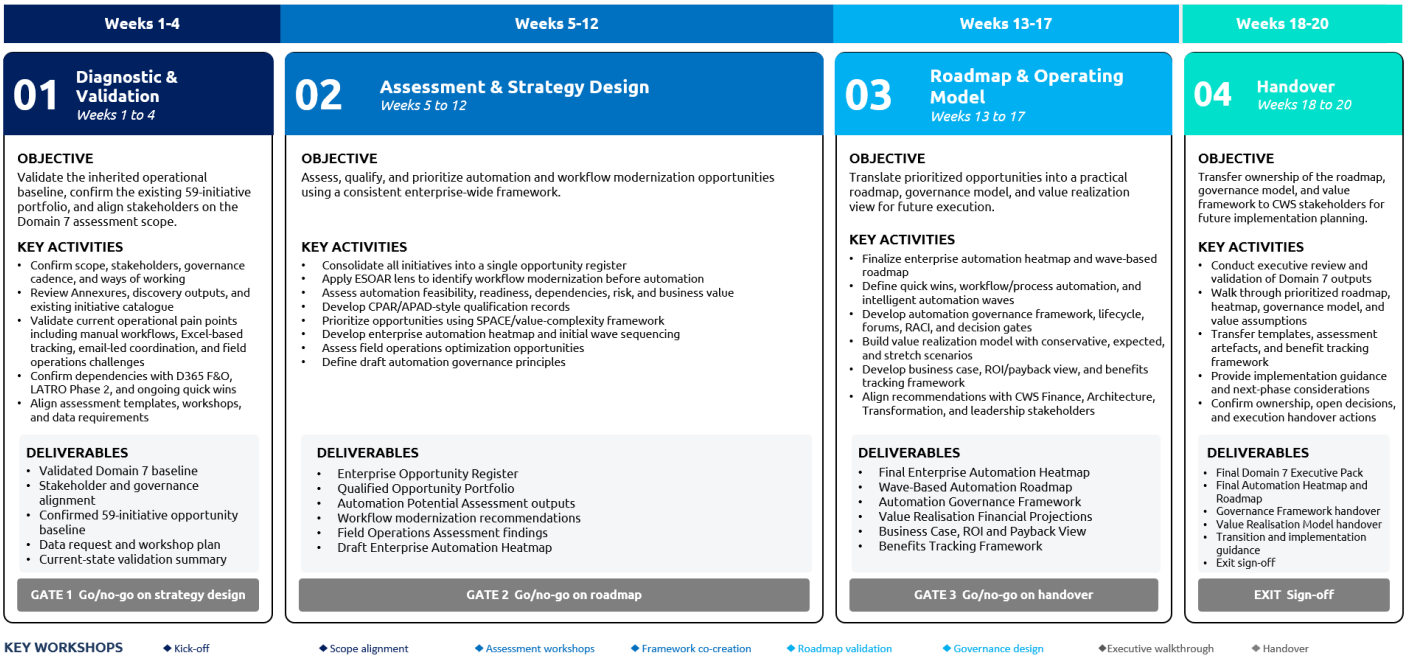

8. Timeline

The Domain 7 workstream will be delivered over the 20-week engagement period, aligned to the overall transformation roadmap. Activities are structured to progressively validate, assess, prioritize, govern, and quantify opportunities, ensuring that each stage

builds on the outputs of the previous phase. The automation opportunity assessment, field operations assessment, and governance activities will run in parallel where appropriate to accelerate delivery while maintaining stakeholder alignment.

Domain 7 — Phased Delivery Roadmap

Operational Efficiency and Automation delivery across the 20-week engagement, with milestones, workshops, and phase gates

Key Outcomes by Phase

- **Phase 1:** Establish a validated and consolidated opportunity baseline.
- **Phase 2:** Assess and prioritize opportunities using a consistent framework.
- **Phase 3:** Develop governance, value realization projections, and implementation sequencing.
- **Phase 4:** Secure stakeholder alignment and transition the roadmap for future execution.

By the end of the engagement, CWS will receive an Enterprise Automation Heatmap, Field Operations Assessment, Automation Governance Framework, Value Realization Model, and a sequenced roadmap to guide future workflow modernization and automation investments.

10. Handover and Boundary of Scope

At the conclusion of the engagement, Capgemini will provide CWS with a complete set of assessment outputs, recommendations, and supporting artefacts required to progress into future implementation phases. The handover will ensure that CWS has a clear understanding of the prioritized opportunities, their business value, implementation dependencies, governance requirements, and recommended sequencing.

The engagement deliverables will collectively provide a structured roadmap for workflow modernization, automation adoption, and future AI-enabled operations, enabling CWS to make informed investment and execution decisions.

Handover Deliverables -

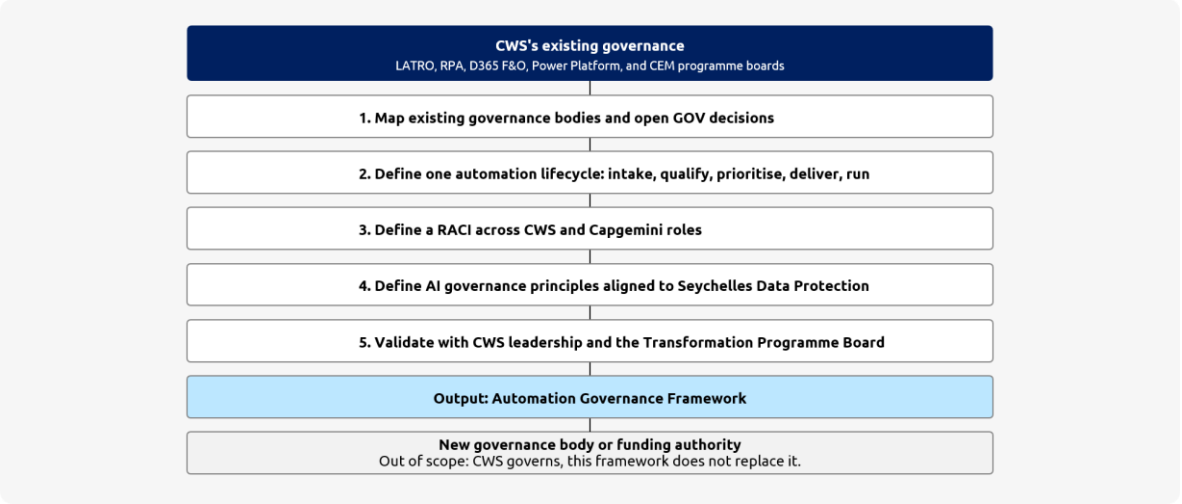

All the deliverables mentioned below has be explained in the above sections.

- Enterprise Automation Heatmap and Prioritized Opportunity Portfolio - explained in Section 4
  Wave-Based Automation Roadmap – explained in Opportunity Sequencing Framework
- Field Operations Assessment and Recommendations- explained in Section 4
- Automation Governance Framework – explained in Section 11
- Value Realization and Benefits Tracking Framework – explained in Section 12
- Business Case and Financial Projections – Explained in Section 12
- Supporting Assessment Artefacts and Assumptions – explained in section 4

11. Governance and Operating Model

Effective governance is critical to ensuring that automation opportunities are consistently assessed, prioritized, governed, and transitioned into future implementation. Capgemini will define a practical governance and operating model that aligns with existing CWS leadership structures and transformation program, while establishing clear ownership, decision-making processes, and accountability across the automation lifecycle.

The approach builds upon CWS's existing governance mechanisms rather than creating parallel structures, ensuring alignment with broader transformation initiatives, including D365 Finance & Operations, LATRO Phase 2, Data Strategy, AI Governance, and Workforce Transformation program.

11.2 Governance Objectives

The Automation Governance Framework will enable CWS to:

- Align automation investments with business strategy and transformation priorities.
- Establish consistent decision-making and prioritization criteria.
- Manage risks, dependencies, and compliance requirements.
- Monitor delivery performance and business outcomes.
- Track and realize expected benefits from automation investments.
- Support the future adoption of intelligent automation and AI capabilities.

Deliverable – Automation Governance Framework

- **Output Format**
  - Executive presentation deck
- **Up to 4 slides/pages**
  - Includes governance structure, operating model, roles & responsibilities (RACI), prioritization principles, risk/dependency management approach,
- **Scope**
  - Includes: Governance model for automation and AI initiatives, decision-making structure, prioritization controls, , benefit tracking governance, and alignment with existing transformation programs.
  - **Excludes:** Governance implementation, PMO operations, policy creation, compliance reviews, resource management, vendor governance, and day-to-day governance administration.

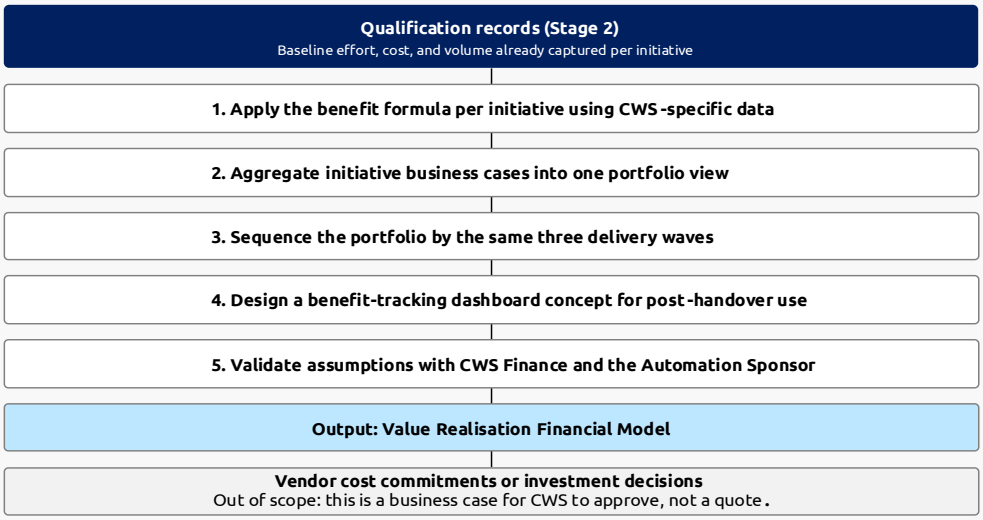

Roles and Responsibilities

Role	Responsibility
Executive Sponsor	Strategic direction and final approval
Process Owners	Validate business processes, opportunities and priorities
Domain Architects	Confirm integration, technology, and platform dependencies
Automation & Transformation Leads	Define automation priorities and target-state direction
Finance Representatives	Validate assumptions, business cases, and value projections
Capgemini Advisory Team	Facilitate assessments, prioritization, governance design, and roadmap development

12 Value Realisation Financial Projections

Value realization translates prioritized opportunities into a quantified business case, enabling CWS to understand the potential impact of workflow modernization, automation, and future intelligent operations initiatives. Building upon the outputs of the Automation Opportunity Assessment and Governance Framework, this workstream provides a structured approach for estimating benefits, evaluating investment priorities, and establishing a framework for tracking value over time.

Objective: Develop a business-led view of the potential financial and operational benefits associated with prioritized initiatives, supported by a transparent value realization methodology and benefits tracking framework.

12.1 Benefit Categories

Benefits will be assessed across both financial and non-financial dimensions to provide a balanced view of expected business value.

Benefit Category	Illustrative Measures
Effort Reduction	Manual effort reduction, capacity released, productivity gains
Cost Optimization	Reduced operational costs and improved cost-to-serve
Revenue Protection	Reduced revenue leakage, improved billing accuracy
Service Performance	Faster cycle times, SLA improvements, reduced backlog
Quality Enhancement	Reduced errors, rework, and operational exceptions
Customer Experience	Faster response times and improved customer outcomes
Field Operations Efficiency	Improved scheduling, reduced travel time, higher first-time resolution

12.2 Value Realisation Approach

As implementation is outside the scope of this engagement, benefits will be presented as **forecasted value projections** based on assessment findings, business inputs, and defined assumptions.

Step	Description	Output
Benefit Assessment	Quantify opportunity-level benefits using process volumes, effort, quality, and performance measures	Use Case Benefit Assessment
Scenario Modelling	Develop conservative, expected, and stretch value scenarios	Benefits Forecast Model
Investment Analysis	Assess indicative implementation effort, costs, ROI, and payback ranges	Business Case & ROI Analysis
Value Tracking Design	Define KPIs, ownership, measurement approach, and reporting mechanisms	Value Realization Framework

12.3 Deliverables and Outputs

The value realization assessment will consolidate opportunity-level findings into an enterprise-wide portfolio view, enabling CWS to evaluate potential investments across all prioritized initiatives.

Key deliverables include:

- Use Case Benefit Assessment Sheets
- Automation Value Realization Portfolio
- Business Case, ROI & Payback Analysis
- Benefits Tracking & Value Governance Framework

Together, these deliverables will provide CWS with a repeatable mechanism for evaluating, prioritizing, and tracking automation investments throughout future implementation phases.

12.4 Assumptions and Basis of Estimate

The value realization assessment is intended to support business planning and investment prioritization. All projections will be based on available operational data, stakeholder inputs, and industry benchmarks where required.

Key assumptions include:

- Benefits presented are forecasted estimates and not realized outcomes.
- Actual value realization will depend on implementation approach, adoption levels, and operational execution.
- Baseline effort, volume, and cost data will be sourced from assessment findings and CWS-provided information wherever available.
- Industry benchmarks may be used where data is unavailable and will be clearly identified.
- No vendor pricing, procurement decisions, or implementation commitments are included within this assessment.

H. Domain 8 - Commercial Growth and Digital Revenue

Mapping to RFP Expected Deliverables

Deliverables below are scoped to digitally-enabled revenue and monetisation opportunities arising from CWS's transformation, delivered as strategy and business-case artefacts rather than go-to-market execution support.

#	Deliverables expected in RFP	Mapping to Response
1	Digital growth strategy	Commercial Growth Vector 2
2	Product/service roadmap	Commercial Growth Vector 1
3	Pricing and bundling innovation assessment	Commercial Growth Vector 5
4	Partner ecosystem strategy	Commercial Growth Vector 4
5	Data monetisation opportunity assessment	Commercial Growth Vector 3
6	Revenue uplift business cases	Step 4 – Business Case development

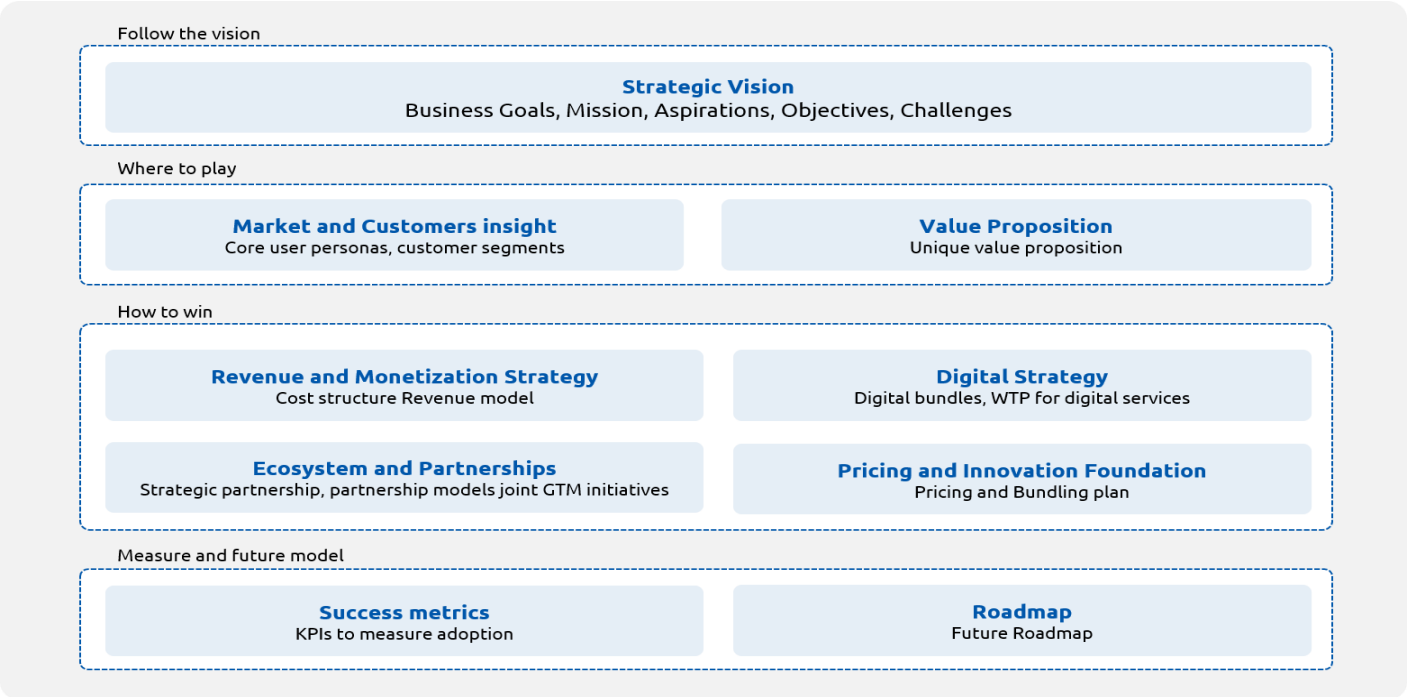

Ask

Strategic question we are answering: how does CWS unlock new revenue streams, improve ARPU, and position itself as the leading digital enabler in the Seychelles market leveraging under-monetised infrastructure assets (5G, Tier IV data centre, fibre, MPLS) without over-reaching into playbooks that require large-market scale?

CWS's commercial upside is not primarily ARPU squeeze on the retail base. It sits in unlocking its monetisation vectors that under-utilise the existing asset base. We deliver Domain 8 as an independent track using a proven four-move commercial framework, executed through a four-stage phased approach.

Commercial Growth Framework

Our end-to-end growth framework cuts through commercialization complexity to unlock scalable, market-ready impact for CWS. To win in the market, CWS must follow on its bold vision to a scalable, monetized solution in four strategic directions:

Follow The Vision

Anchor the strategic direction in CWS's mission, long-term goals, and most pressing business pain points ensuring every growth opportunity is clearly linked to customer needs, commercial priorities, infrastructure strengths, and the realities of the Seychelles market.

Where to Play

Identify the highest-value customer segments, validate where CWS has the strongest right to play, and refine the value proposition around clear market needs, adoption potential, and differentiated infrastructure-led advantages.

How to Win

Define how CWS will win in market by shaping commercially viable revenue models, high level go-to-market plans, the right partnership ecosystem, and the pricing foundations needed to scale new propositions with speed, credibility, and operational discipline.

Measure and Optimize Framework

Define the right KPIs, establish a clear success measurement framework aligned to each business case, and create a practical mechanism to track performance, capture learnings, and continuously optimise growth initiatives based on market response and commercial impact.

Approach

We will follow a structured four-stage delivery approach comprising Discover, Design, Position, and Strategize with each stage producing clearly defined deliverables that inform and build on the next.

We are using this approach to cover the outcomes

Key	Output	Key	Output
O1	Digital growth strategy	O4	Partner ecosystem
O2	Product/service roadmap	O5	Data monetisation
O3	Pricing & bundling	O6	Business cases

Summary of our Approach

Stage	Purpose	Timing	Key activities	Deliverables
Discover	Align on the ambition	Weeks 1–4	We build an independent view of CWS's commercial current state. Inheriting the four departmental discoveries, we cross-reference revenue signals across LATRO, Cerillion, and Finance to reconstruct what CWS actually earns by product line, segment, and channel. In parallel we audit every commercial asset (Tier IV capacity, 5G footprint, MPLS, submarine capacity, spectrum, retail, mobile/billing/CDR data) for its under-monetisation gap and scan the market for 4–5 credible growth whitespaces. By week 4 we know what CWS earns today, what its assets could earn, and where the growth spaces sit.	Commercial Diagnostic Report *(baseline)* | Revenue Baseline Model *(→ O6)* | Under-Monetised Asset Register *(→ O1)* | Whitespace Analysis *(→ O1)*
Design	Identify & prioritise segments and vectors	Weeks 5–9	We turn diagnostic evidence into strategic direction. Segments get assessed for maturity and headroom with the portfolio rebalanced accordingly, whitespaces get scored against value, feasibility, dependency, and resource intensity, and we kick off the data monetisation opportunity with consumers, business processes, and governance guardrails already in the frame. The phase ends with a defensible view of where CWS should play and, just as important, where it should not.	Segment Prioritisation Report *(→ O1, O4)* | Whitespace Prioritisation Report *(→ O1)* | Data Monetisation Opportunity Value Proposition *(→ O5)*
Position	Value proposition, channel, monetisation	Weeks 10–15	We go deep on the shortlisted sectors. Each sector gets a value proposition, monetisation model, and GTM approach (household bundles, data-centre wholesale, and the others surfaced in Design). Pricing is diagnosed and bundling engineered across household, enterprise-cloud, and government framework contracts. Partner anchors are named across Government, Business, and Consumer. Data monetisation gets detailed by segment and sector. Every high-priority use case earns a business case. This is where "we should" becomes "here is how."	Sector-wise Value Prop and Business Model Canvas *(→ O1)* | Pricing & Bundling Package *(→ O3)* | Per-sector Business Case Models *(→ O6)* | Partner Ecosystem Map *(→ O4)* | Data Monetisation Detailed Report *(→ O5)*
Strategize	Launch plan and KPIs	Weeks 16–20	We consolidate everything into a strategy, roadmap, and operating model that CWS can defend at the Board. The 3-year Digital Growth	Digital Growth Strategy *(→ O1)* | Product/Service Roadmap *(→ O2)* |

Stage	Purpose	Timing	Key activities	Deliverables
			Strategy is drafted alongside a refined view of the 57-item catalogue. The Commercial Target Operating Model names who runs it (CCO organisation, Pricing Council, Partner Management, Data Monetisation governance). The 3-year product and service roadmap, KPI framework, and consolidated business case pack complete the package. We then hand over cleanly, artefact by artefact, against an aligned responsibility matrix, so the strategy has a home from Day 1.	Consolidated Business Case Pack *(→ O6)* | Commercial Target Operating Model *(execution layer)* | Commercial KPI Framework *(handover artefact)* | Knowledge Transfer Log *(handover artefact)*

Key Deliverables

Commercial Diagnostic Report - Assessment of CWS's current commercial landscape, revenue streams, digital products and services, customer segments, monetization approaches, and growth opportunities relevant to its Digital Service Provider (DSP) ambitions.

- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes current-state assessment, key findings, growth constraints, and recommendations
- **Scope Boundaries**
  - Includes strategic commercial assessment based on stakeholder inputs, available documentation, and existing discovery outputs.
  - Excludes market research, customer surveys, financial audits, competitor benchmarking studies, and commercial due diligence activities.
- **Revenue Baseline Model -** High-level view of current revenue streams and revenue categories to establish a baseline against which future digital, AI-enabled, and data-driven commercial opportunities can be evaluated.
- Output Format
  - Executive presentation deck
  - Upto 3 slides/pages
  - Includes revenue categories, revenue drivers, and baseline observations
- **Scope Boundaries**
  - Includes directional revenue baseline assessment.
  - Excludes detailed financial analysis, audited revenue validation, forecasting models, and financial planning activities.

Under-Monetized Asset Register - Identification of existing digital, data, technology, operational, and service assets that may present opportunities for improved monetization, commercialization, or value extraction.

- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes asset inventory, monetization themes, and opportunity areas
- **Scope Boundaries**
  - Includes strategic opportunity identification.
  - Excludes asset valuation, detailed commercial assessments, legal reviews, or implementation planning.
- **Whitespace Analysis -** Assessment of potential growth opportunities, unmet customer needs, emerging business opportunities, and adjacent revenue streams aligned with CWS's Digital & AI strategy.
- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes opportunity areas, strategic themes, and prioritization recommendations
- **Scope Boundaries**
  - Includes high-level opportunity identification and strategic recommendations.
  - Excludes detailed market sizing, customer demand validation, commercial product design, and implementation planning.
- **Segment Prioritization Report -** Strategic evaluation and prioritization of target customer segments based on growth potential, strategic fit, market opportunity, and alignment to future digital and AI-enabled offerings.
- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes segment assessment, prioritization rationale, and recommendations
- **Scope Boundaries**
  - Includes strategic segmentation recommendations.
  - Excludes detailed market research, customer analysis, sales planning, and account-level targeting.

- **Whitespace Prioritization Report -** Prioritized view of identified growth opportunities based on strategic relevance, feasibility, value potential, and alignment to CWS's transformation objectives.
- **Output Format**
  - Executive presentation deck
  - Upto 3 slides/pages
  - Includes prioritization framework, recommended opportunities, and value considerations
- **Scope Boundaries**
  - Includes opportunity prioritization recommendations.
  - Excludes detailed feasibility studies, investment analysis, and implementation planning.
- **Data Monetization Opportunity Value Proposition -** Definition of strategic value propositions for selected data-driven and AI-enabled monetization opportunities, including anticipated customer value, business impact, and indicative commercialization approaches.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes opportunity descriptions, value propositions, target beneficiaries, and strategic recommendations
- **Scope Boundaries**
  - Includes conceptual monetization opportunities and value propositions.
  - Excludes product design, commercial packaging, pricing execution, legal review, privacy assessments, and operational implementation.
- **Sector-wise Value Proposition & Business Model Canvas -** Development of high-level value propositions and business model canvases for selected priority sectors aligned to CWS's Digital Service Provider strategy.
- Output Format
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes sector opportunities, value propositions, business model components, and strategic recommendations
- **Scope Boundaries**
  - Includes conceptual business model recommendations for priority sectors.
  - Excludes detailed operating models, product development, go-to-market planning, and commercialization execution.
- **Pricing & Bundling Package -** Strategic recommendations for pricing approaches, service bundling options, and commercial packaging concepts aligned to future digital and AI-enabled offerings.
- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes pricing principles, bundling concepts, and strategic recommendations
- **Scope Boundaries**
  - Includes indicative pricing and packaging guidance.
  - Excludes pricing model development, financial analysis, tariff development, commercial approvals, and market testing.
- **Per-Sector Business Case Models -** High-level business case summaries outlining indicative value potential, benefits, investment considerations, and strategic viability of priority opportunities across selected sectors.
- **Output Format**
  - Executive presentation deck
  - Upto 1 page per priority sector (up to 5 pages total)
- **Scope Boundaries**
  - Includes directional business-case estimates and assumptions.
  - Excludes investment-grade financial models, detailed forecasting, budgeting, financial validation, and approval documentation.
- **Partner Ecosystem Map -** Strategic view of potential ecosystem partners, capability providers, technology partners, and collaboration opportunities required to enable future digital, data, and AI-led offerings.
- **Output Format**
  - Executive presentation deck
  - Upto 4 slides/pages
  - Includes ecosystem landscape, partnership categories, and collaboration recommendations
- **Scope Boundaries**
  - Includes partner ecosystem mapping and strategic recommendations.
  - Excludes partner evaluations, procurement activities, commercial negotiations, contract reviews, and partner onboarding.
- **Data Monetization Detailed Report -** Consolidated assessment of data monetization opportunities, market relevance, business value, dependencies, risks, and implementation considerations aligned to CWS's strategic objectives.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes opportunity portfolio, value themes, risks, dependencies, and recommendations
- **Scope Boundaries**
  - Includes strategic assessment of monetization opportunities.

  - Excludes commercial product design, legal assessments, regulatory reviews, technical implementation plans, and monetization execution.
- **Digital Growth Strategy -** Strategic framework defining growth ambitions, commercial priorities, monetization themes, Digital & AI-enabled growth opportunities, and future revenue pathways.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes growth vision, strategic pillars, opportunity areas, and recommendations
- **Scope Boundaries**
  - Includes strategic growth recommendations and priorities.
  - Excludes sales strategy development, marketing plans, campaign execution, and commercial operations design.
- **Product / Service Roadmap -** Prioritized roadmap outlining the sequencing of future digital services, AI-enabled offerings, monetization initiatives, and supporting business capabilities.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes roadmap, priorities, dependencies, and implementation guidance
- **Scope Boundaries**
  - Includes strategic roadmap recommendations.
  - Excludes product development plans, release schedules, technical requirements, and implementation management.
- **Consolidated Business Case Pack -** Enterprise-level summary of prioritized opportunities, indicative benefits, value potential, investment considerations, and strategic recommendations.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes portfolio view of opportunities, assumptions, benefits, and recommendations
- **Scope Boundaries**
  - Includes directional business-case insights and strategic recommendations.
  - Excludes investment-grade financial models, investment approvals, procurement support, and financial sign-off activities.
- **Commercial Target Operating Model -** High-level commercial operating model defining governance principles, commercial capabilities, roles, operating mechanisms, and enablement requirements required to support future growth initiatives.
- **Output Format**
  - Executive presentation deck
  - Upto 5 slides/pages
  - Includes operating model structure, capability requirements, governance recommendations, and operating principles
- **Scope Boundaries**
  - Includes conceptual future-state operating model recommendations.
  - Excludes organizational restructuring, detailed role definitions, process design, staffing plans, and operating model implementation.
- **Commercial KPI Framework -** Recommended framework for measuring commercial performance, growth outcomes, monetization effectiveness, and realization of strategic objectives.
- **Output Format**
  - Executive presentation deck
  - Upto 3 slides/pages
  - Includes KPI categories, measurement principles, and governance recommendations
- **Scope Boundaries**
  - Includes KPI recommendations and measurement principles.
  - Excludes dashboard development, KPI implementation, reporting processes, and performance management operations.
- **Knowledge Transfer Log -** Structured handover of assumptions, recommendations, methodologies, deliverables, and key decisions to designated CWS stakeholders.
- **Output Format**
  - Knowledge transfer session
  - Supporting handover document
  - Upto 3 slides/pages
- **Scope Boundaries**
  - Includes walkthrough of deliverables and supporting artefacts.
  - Excludes training programs, commercialization support, advisory retainers, and post-project operational assistance.
- **Domain 8 Deliverable Boundaries**
  - All Domain 8 deliverables are advisory and strategy-oriented in nature and are intended to identify, evaluate, and prioritize digital, data, and AI-enabled commercial growth opportunities aligned with CWS's Digital Service Provider strategy.
  - Unless explicitly stated, deliverables will be limited to 3-5 slides/pages per output and delivered as executive-level presentation artefacts.

Phased Delivery Roadmap

Domain 8 – Phased Delivery Roadmap

Commercial Growth and Digital Revenue delivery across the 16 to 20 week engagement, with milestones, workshops, and phase gates

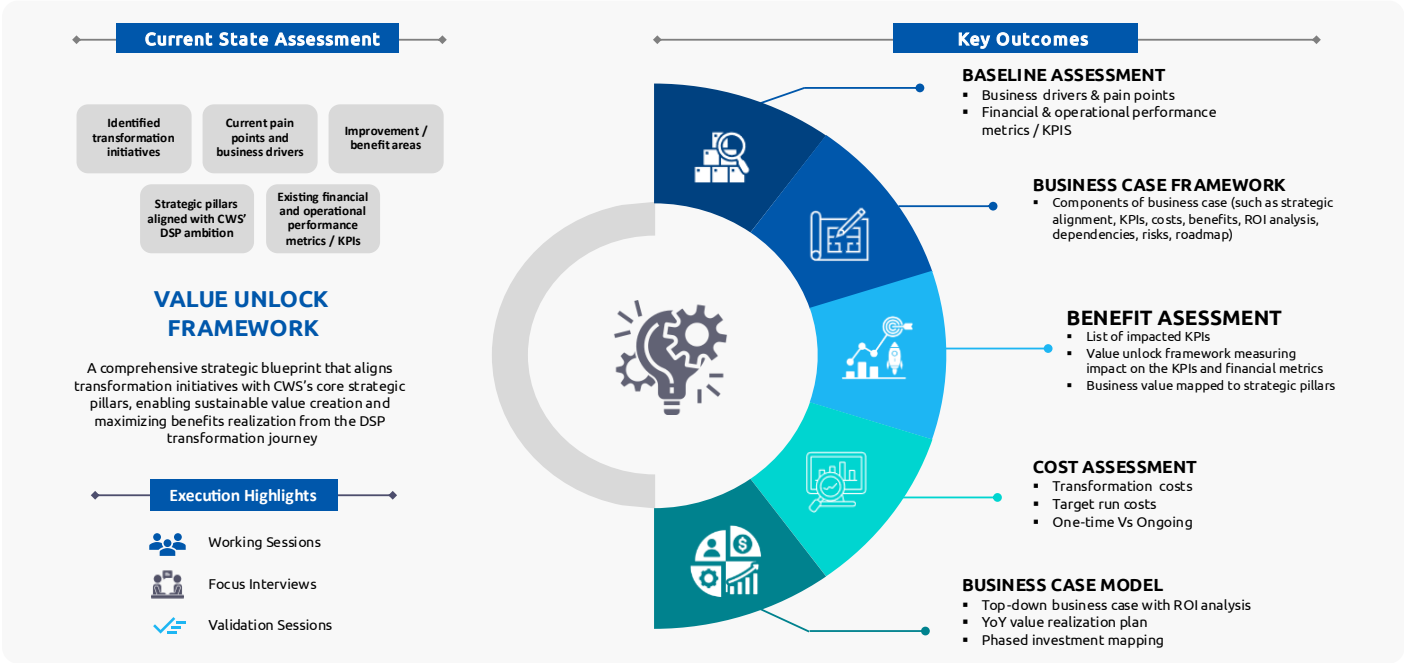

Weeks 1-4	Weeks 5-12	Weeks 13-17	Weeks 18-20
01 Diagnostic & Validation *Weeks 1 to 4*	**02 Strategy Design** *Weeks 5 to 12*	**03 Roadmap & Operating Model** *Weeks 13 to 17*	**04 Handover** *Weeks 18 to 20*
KEY ACTIVITIES • **Absorb** the four commercial-relevant discoveries (Marketing & Sales, Products, Finance/RA, Tech/BSS) and tag the commercial subset of the 57-item catalogue against commercial relevance. • **Executive validation** interviews with key stakeholders (CCO, Sales Heads by segment, Products, Pricing, Wholesale, DC lead, RA lead, Finance BP). • **Reconstruct** the revenue baseline from key departments like LATRO, Cerillion, split by product line, segment, channel which sets base for business case. • **Asset utilization** audit to identify Tier IV capacity, 5G footprint, MPLS, submarine capacity, spectrum, retail, mobile/billing/CDR data which will help identify Under-Monetized Asset Register with per-asset gap quantification. • **Assess the market** to understand the whitespaces for growth and identify 4–5 key open areas which will set the base for digital growth strategy.	**KEY ACTIVITIES** • Segment maturity assessment and portfolio rebalancing by assessing the segments and how the portfolio is distributed among various segments and where the headroom is for expansion and rebalance accordingly. • Whitespace prioritization scorecard against value, feasibility, dependency, and other factors to identify the commercial and resources input to each area. • Initiate data monetization assessment by identifying the consumers, business process and guardrails.	**KEY ACTIVITIES** • Identified sector deep dive like household bundles, data center wholesale and others with per sector value proposition, monetization model, and GTM approach. • Pricing diagnostic and bundling blueprint across segments of consumers and sectors like household, enterprise-cloud, and government framework contract. • Partner ecosystem strategy across Government, Business, and Consumer segments with named anchor partners. • Detail the data monetization opportunity with respect to each segment and sector. • Build the business case on high prioritized use case identified.	**KEY ACTIVITIES** • Create the digital product and service roadmap for next 3 years. • Draft the commercial 3-year – Year Digital Growth Strategy along with refined catalogue. • Formal artefact handover, structured knowledge-transfer sessions with CWS employees with aligned responsibility matrix. • Build the Commercial Target Operating Model (CCO organization, Pricing Council, Partner Management, Data Monetization governance). • Commercial KPI framework (revenue, ARPU/ARPA, wholesale, vector-specific KPIs) with monthly review cadence.
DELIVERABLES • Commercial Diagnostic • Report Revenue Baseline • Model Under-Monetized Asset • Register Whitespace analysis	**DELIVERABLES** • Segment Prioritization Report • Whitespace Prioritization Report • Data Monetization opportunity value proposition	**DELIVERABLES** • Sector wise Value Prop and Business Model Canvas • Pricing & Bundling Package • Per-sector Business Case Models • Partner Ecosystem Map • Data Monetization detailed report	**DELIVERABLES** • Product/Service Roadmap • Digital Growth Strategy • Commercial KPI Framework • Commercial Target Operating Model • Consolidated Business Case Pack • Knowledge Transfer Log
GATE 1 Go/no-go to Phase 02	GATE 2 Go/no-go to Phase 03	GATE 3 Go/no-go to Phase 03	EXIT Sign-off

KEY WORKSHOPS ◆ Kick-off ◆ Validation ◆ Framework co-creation ◆ Use case design ◆ Operating model ◆ Roadmap review ◆ Handover

Financial Business Case and ROI Analysis Methodology

This is focused on creating a fact-based understanding of the current state, quantifying value opportunities, and developing an investment-led roadmap that balances business ambition with execution realities.

It closely aligns with CWS's requirement to validate the inherited transformation baseline, assess strategic priorities across core domains, and build an actionable roadmap under the guiding principle of "Data before AI, Workflow before Automation, Integration

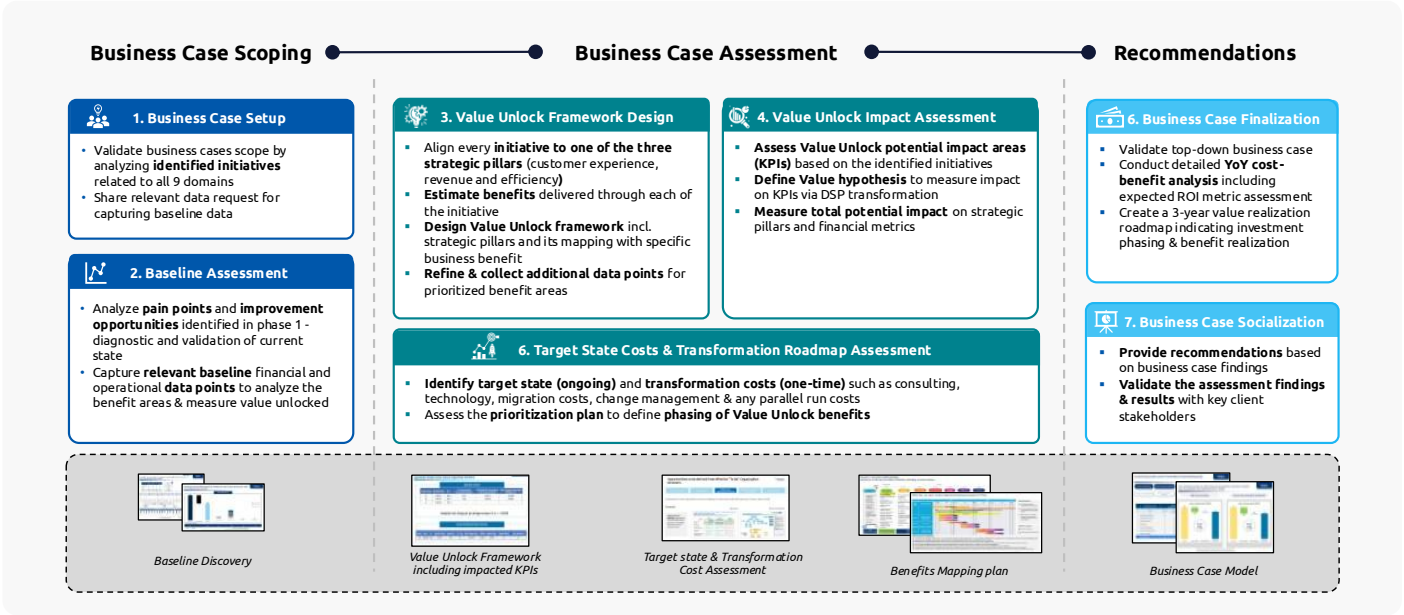

before Scale."

Our business case methodology begins with a comprehensive baseline assessment to establish a fact-based view of the organization's current state. Through leadership workshops, stakeholder interviews, and analysis of financial and operational performance metrics, we validate strategic drivers, business pain points, capability gaps, and transformation opportunities. This enables the creation of a structured Value Unlock Framework that links transformation initiatives to the organization's strategic objectives and quantifies the expected impact across key value dimensions such as customer experience, revenue growth, and operational efficiency. The framework also defines the KPI architecture required to measure benefits realization and provides a clear line of sight between strategic ambitions and business outcomes.

Building on this foundation, we develop a robust business case by assessing the value, costs, risks, and dependencies associated with the transformation initiative. Benefits are quantified through measurable KPI improvements and financial outcomes, while

costs are modeled across one-time investments, technology enablement, change management, and target-state operating expenses. The analysis is then consolidated into an ROI-driven business case and phased transformation roadmap that prioritizes investments based on strategic alignment, business impact, feasibility, and implementation dependencies. The result is a transparent decision-making framework that enables leadership to validate investment choices, establish benefit ownership, and execute transformation through a structured value realization approach.

A well-defined business case approach for initiatives qualifying for financial assessment

Our approach follows a structured and collaborative business case assessment journey, moving from opportunity identification coming from the domains to executive-approved recommendations. Beginning with **business case scoping and baseline validation**, we leverage available data, stakeholder inputs, and domain insights to establish a common understanding of priorities, challenges, and desired outcomes, for the initiatives qualifying for financial assessment. Typically, initiatives with upfront investments or offering potential savings qualify for the financial assessment. We then translate these insights into a strategic value framework, assessing how each initiative contributes to CWS' enterprise objectives and evaluating potential impacts across business performance, customer outcomes, and operational effectiveness. This ensures that transformation opportunities are evaluated consistently and objectively, enabling leadership to focus on initiatives that deliver the greatest strategic value.

Following business case scoping and baseline validation, we design a **Value Unlock Framework** that establishes a clear linkage between transformation initiatives, strategic objectives, and measurable business outcomes. Each initiative is mapped to strategic pillars and associated value drivers, with specific **leading KPIs** defined to measure success. The framework provides a structured method to identify, categorize, and quantify benefits across dimensions such as customer experience, revenue growth and protection, operational efficiency, risk reduction, productivity improvement, and digital capability enhancement. This creates a common language for evaluating initiatives and ensures that business benefits are consistently measured across the transformation portfolio.

The next phase focuses on **Value Unlock Impact Assessment**, where we evaluate the magnitude, timing, and feasibility of benefits associated with each initiative. Through **result KPI** impact modelling, benefits mapping, financial analysis, and stakeholder validation workshops, we quantify expected outcomes and assess their contribution to strategic objectives. The assessment also considers interdependencies, value realization timelines, and key assumptions that may influence benefit attainment.

The assessment is complemented by a rigorous review of **transformation costs and target state operating costs**, implementation dependencies, and execution considerations to develop a realistic target-state roadmap. By combining benefit analysis with investment requirements, we create a **phased cost-benefit assessment**. The final stage focuses on validating findings with CWS key stakeholders, refining investment priorities, and building alignment around the recommended roadmap, ensuring the business case is not only financially viable but also practical, executable, and supported across the organization.

I. Domain 9 - Enterprise AI Strategy and Governance

Our Understanding

CWS has stated the ambition that AI should be a core enterprise capability, not a set of discrete products bolted onto existing systems. The RFP has already established the non-negotiable strategic principle of "Data before AI. Workflow before automation. Integration before scale." It has already adopted a "sanctioned environment with data classification" posture. It has already committed to a four-tier data classification scheme. And it has explicitly told bidders that AI governance precedes AI deployment, not the other way around.

What CWS does not yet have is a complete framework extending this posture into an operable, auditable, enterprise-wide governance system that can carry the organization through the Digital Service Provider (DSP) transition. Specifically, the discovery baseline surfaces four material gaps.

An AI use case portfolio exists in fragments across the 57-item catalogue (chatbots, churn prediction, predictive maintenance, revenue assurance automation, AIOps evolution), but there is no consistent value-risk-feasibility view across the enterprise.

The data classification scheme exists in principle but has not been ratified across departments, meaning the same customer or billing dataset may be handled differently by CX, Finance, and Network teams.

There is no AI operating model. It is unclear who owns AI use case intake, who approves risk tier assignments, who audits deployed models, or how AI incidents are managed.

The Seychelles regulatory trajectory is uncertain. Seychelles currently lacks AI-specific legislation, but the Seychelles Data Protection Act, telecom sector confidentiality obligations, and the likely trajectory toward local AI regulation all shape what CWS can and cannot do today and in the next three years.

Our Point-of-view

Three aspects shape our approach and differentiate it from a generic AI strategy engagement:

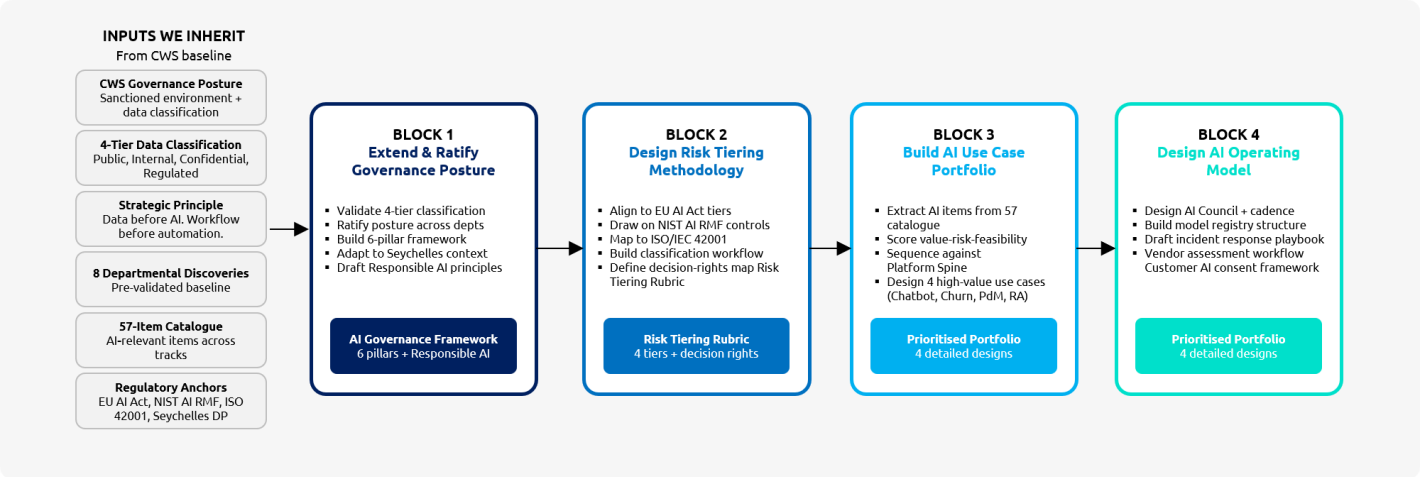

- **AI governance is not a document, it is an operating system**. Most consulting responses to an AI governance question produce a policy PDF, a set of principles, and a risk matrix. That is the visible layer, and CWS will get all of that. The layer beneath is the operating system, meaning the intake process, the model registry, the risk tiering committee cadence, the deployment gates, the incident response playbook, the vendor assessment workflow, and the audit rhythm. Our outputs are designed to be operable by CWS from the day Capgemini hands it over.
- **AI use cases and AI governance is one artefact,** not two. Reason being, if the use case portfolio and the governance framework are built in isolation, the portfolio contains use cases the governance framework cannot handle, and the framework contains rules the portfolio does not test. We build them together, with every prioritized use case carrying an explicit risk tier, a data classification touch, a vendor assessment position, and a deployment gate. That is what execution-ready means for AI at CWS.
- **Domain 9 must sequence against the Platform Spine, not ahead of it.** Several of the highest-value AI use cases in the 57-item catalogue (AI chatbots, AI churn prediction, predictive maintenance) depend on the Enterprise Data Platform, the integration layer, and the CEM foundation being materially in place. Our AI roadmap is a value-risk-feasibility ordering that respects the sequencing principle. Where a use case's data foundation is not ready, we say so explicitly and phase it accordingly.

Our Approach

Our approach adapts Capgemini's proprietary AI governance and Responsible AI framework to the specific realities of CWS - the Seychelles context, the inherited baseline, the Microsoft-first architectural stance, and the three parallel workstreams (Strategy, Tech Partner RFI, D365 F&O). The methodology is organized into four sequential building blocks:

Building Block 1 - Extend and ratify the CWS governance posture: We begin with the "sanctioned environment with data classification" posture already adopted by CWS. We validate the four-tier data classification scheme across all departments, close the gaps between principle and practice, and formally ratify the scheme as the governance baseline. We then build the complete AI Governance Framework on top of this baseline, structured around six pillars, meaning **purpose and principles, risk tiering, data classification, vendor and platform controls, human oversight and consent, and audit and transparency.** This block also produces the responsible AI principles adapted to the Seychelles context, including specific treatment of the Seychelles Data Protection Act and telecom sector confidentiality obligations.

- **Building Block 2 - Design the risk tiering methodology**: We align the risk tiering methodology to the EU AI Act classification approach, which the RFP names. Every AI use case is assigned to one of four risk tiers, meaning prohibited, high risk, limited risk, and minimal risk, using an assessment structure that draws on NIST AI RMF v1.0 controls and ISO/IEC 42001 management system requirements. The output is a risk tiering classification, a use case classification workflow, and a

decision-rights map showing how to approach a use case across each lifecycle stage gate and who approves each tier.

- **Building Block 3 - Build the AI use case portfolio**: We start from the AI-relevant items in the 57-item catalogue. We prioritize using a value-risk-feasibility framework that assesses each use case against three axes, meaning expected business value (CX, revenue, efficiency), risk tier (per building block 2), and technical feasibility given the state of the Platform Spine and the sequencing constraint. Each prioritized use case receives a design outline covering the data it consumes, the model class, the deployment environment (within sanctioned boundaries), the governance controls that apply, and the KPI framework. For the four high-value candidates named in the RFP (chatbots, churn, predictive maintenance, revenue assurance), we produce full use case designs.
- **Building Block 4 - Design the AI operating model**: This is where the framework becomes an operating system. We design the AI intake and lifecycle process, the model registry structure, the human oversight roles, the AI Council governance structure and cadence, the incident response playbook, the vendor and platform assessment workflow, and the audit rhythm.

We also produce the customer AI consent framework, aligned to the Seychelles Data Protection Act and future AI regulatory trajectory. The operating model is designed to be run by CWS's own team after handoff, with Capgemini's role being to design, transfer, and train.

Key Frameworks & Deliverables

Frameworks below are scoped to the AI governance and use-case portfolio required under Section 8/Domain 9 of the RFP, delivered as decision-ready frameworks rather than a fully operational AI governance function.

The Domain 9 workstream produces the following RFP-mandated outputs:

- Enterprise AI Use Case Portfolio, prioritized by value, risk, feasibility.
- Complete AI Governance Framework extending the CWS placeholder posture
- AI ethics and responsible AI principles adapted to the Seychelles context
- AI risk management methodology aligned with NIST AI RMF, ISO/IEC 42001, and EU AI Act
- AI skills and operating model design
- Regulatory trajectory assessment anticipating future Seychelles AI legislation
- Specific use-case designs for high-value candidates - chatbots, churn, predictive maintenance, revenue assurance
- AI vendor and platform assessment framework
- Ratified data classification scheme extending the four-tier baseline
- Customer AI consent framework design
- AI incident response and accountability model

1. Enterprise AI Use Case Portfolio - Consolidated and prioritized portfolio of enterprise AI opportunities aligned to CWS's Digital Service Provider vision, evaluated based on business value, implementation complexity, organizational readiness, risk profile, and strategic relevance.

- **Output Format**
  - Executive presentation deck
  - Includes use-case inventory, prioritization matrix, value assessment, and implementation sequencing recommendations
- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes enterprise-level identification and prioritization of AI opportunities.
  - Excludes detailed requirements gathering, solution design, AI model development, proof-of-concept development, and implementation planning.

2. Enterprise AI Governance Framework - Recommended governance framework defining oversight mechanisms, accountability structures, governance forums, decision-making principles, and operating guidelines required to support responsible adoption of AI across CWS.

- **Output Format**
  - Executive presentation deck
  - Includes governance model, roles, responsibilities, governance processes, and oversight recommendations
- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes strategic governance recommendations aligned to industry-leading AI governance practices.
  - Excludes policy implementation, governance operations, governance tooling, approval workflow design, and governance execution activities.

3. AI Ethics & Responsible AI Principles - Recommended Responsible AI principles adapted to CWS's operating environment and strategic objectives, covering transparency, accountability, fairness, privacy, security, human oversight, and responsible use of AI technologies.

- **Output Format**
  - Executive presentation deck
  - Includes responsible AI principles, governance considerations, and implementation guidance
- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes strategic principles and governance recommendations.
  - Excludes legal interpretation, ethics audits, compliance assessments, policy drafting, and certification activities.

4. AI Risk Management Methodology - High-level methodology outlining recommended approaches for identifying, assessing, monitoring, and mitigating AI-related risks, informed by leading frameworks such as NIST AI RMF, ISO/IEC 42001, and emerging global regulatory practices.

- **Output Format**
  - Executive presentation deck
  - Includes risk categories, assessment methodology, governance mechanisms, and mitigation recommendations
- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes strategic risk management guidance and framework recommendations.
  - Excludes formal risk assessments, regulatory compliance audits, control implementation, certification preparation, and operational risk management activities.

5. AI Skills & Operating Model Design - Future-state AI capability framework outlining required organizational competencies, workforce skill domains, governance responsibilities, and operating model considerations required to support enterprise AI adoption.

- **Output Format**
  - Executive presentation deck
  - Includes capability model, skill domains, operating principles, and workforce recommendations

- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes enterprise-level capability and operating model recommendations.
  - Excludes organizational restructuring, role design, workforce assessments, training development, certification programs, and workforce implementation planning.

6. Regulatory Trajectory Assessment - Assessment of emerging AI regulatory trends and potential implications for CWS, including consideration of global AI regulatory developments and indicative recommendations to support future regulatory preparedness.

- **Output Format**
  - Executive presentation deck
  - Includes regulatory themes, anticipated impacts, risks, and preparedness recommendations
- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes high-level regulatory observations and strategic recommendations.
  - Excludes legal advice, regulatory compliance assessments, legal opinions, compliance implementation, and regulatory certification activities.
- 7. AI Use Case Concept Designs - Conceptual designs for selected high-priority AI opportunities, including representative use cases such as customer service chatbots, churn prediction, predictive maintenance, revenue assurance, and similar business-aligned AI applications.
- **Output Format**
  - Executive presentation deck
  - Includes business objective, conceptual workflow, expected outcomes, dependencies, and implementation considerations
- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes conceptual use-case definition and high-level business design.
  - Excludes functional specifications, technical architecture, model design, algorithm selection, training data assessment, proof-of-concept development, and implementation planning.

8. AI Vendor & Platform Assessment Framework - Structured framework defining the criteria, evaluation dimensions, governance considerations, and decision principles CWS may utilize in the future to assess AI platforms, tools, and solution providers.

- **Output Format**
  - Executive presentation deck
  - Includes assessment criteria, evaluation framework, governance considerations, and selection principles
- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes assessment methodology and framework recommendations.
  - Excludes vendor evaluations, RFP development, product scoring, product comparisons, procurement support, and vendor selection activities.
- 9. Data Classification Scheme Enhancement - Recommended enhancements to CWS's existing data classification approach, extending the current baseline to support AI governance, responsible AI adoption, data protection, and risk management requirements.
- **Output Format**
  - Executive presentation deck
  - Includes classification approach, governance considerations, and AI-related data handling recommendations
- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes strategic recommendations for data classification and governance.
  - Excludes enterprise data classification exercises, data discovery, data tagging, information governance implementation, and policy deployment activities.

10. Customer AI Consent Framework Design - Conceptual framework defining customer consent principles, transparency requirements, notification practices, and governance considerations associated with AI-enabled customer interactions and data usage.

- **Output Format**
  - Executive presentation deck
  - Includes consent principles, governance approach, customer transparency recommendations, and implementation guidance
- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes strategic framework recommendations.
  - Excludes legal review, privacy compliance assessments, consent management implementation, customer communications development, and operational process design.

11. AI Incident Response & Accountability Model - Recommended framework defining governance responsibilities, escalation principles, accountability mechanisms, incident classification conc**epts, and response considerations for AI-related incidents.**

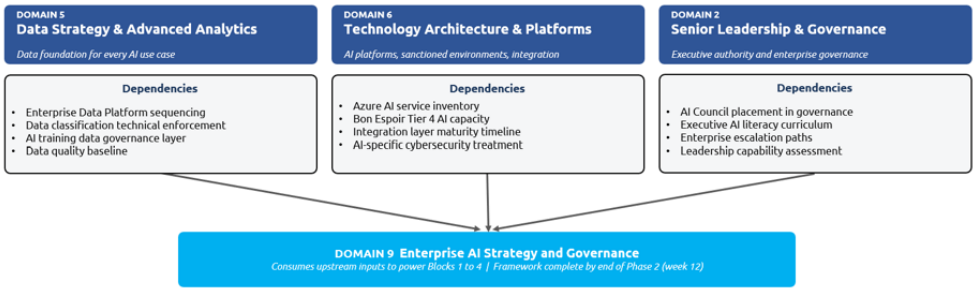

- **Output Format**
  - Executive presentation deck
  - Includes accountability model, escalation approach, governance recommendations, and incident categories
- **Scope Boundaries (To be confirmed after discovery workshops)**
  - Includes strategic governance and accountability recommendations.
  - Excludes operational incident response procedures, SOC processes, cybersecurity incident management, regulatory reporting procedures, and implementation activities.

- **Domain 9 Deliverable Boundaries**
  - All Domain 9 deliverables are advisory and strategy-oriented in nature and are intended to establish the governance, risk management, operating model, capability, and strategic foundations required to support responsible adoption of AI across CWS.
  - Deliverables will focus on AI governance, responsible AI, organizational readiness, use-case prioritization, and implementation guidance aligned to CWS's Digitalization & AI Strategy.

Interlock with Other Domains (Dependencies)

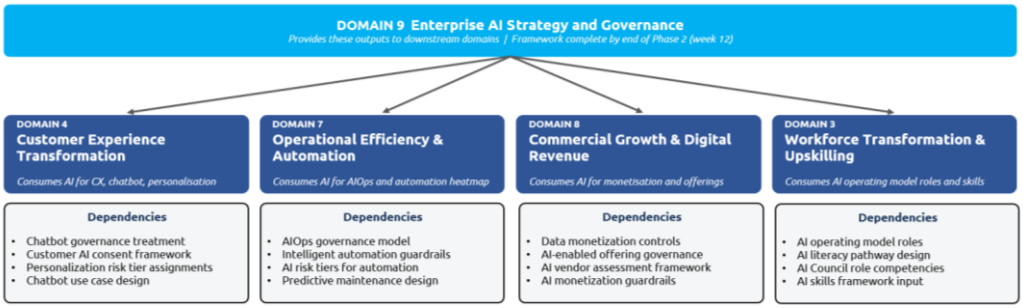

Domain 9 does not stand alone. It sits above every other domain and consumes their outputs. The following interlocks are load bearing.

Upstream (What domain 9 depends on)

- Domain 5 (Data Strategy and Advanced Analytics) provides the Enterprise Data Platform, the data governance framework, and the data quality baseline that AI use cases require. Without Domain 5, the AI use case portfolio cannot be feasibility-scored honestly.
- Domain 6 (Technology Architecture and Platforms) provides the AI platform recommendations, the sanctioned environment implementation (Azure within the CWS enterprise agreement, Copilot within the CWS tenant, on-premise for Tier 4 data), and the cybersecurity alignment. Domain 9 governance decisions constrain Domain 6 architecture choices, and Domain 6 architecture realities constrain Domain 9 use case sequencing.
- Domain 2 (Senior Leadership Engagement and Governance) provides the AI literacy uplift for the leadership team that will chair the AI Council. Domain 9 defines the AI Council's authority. Domain 2 makes it operable.

Downstream (What domain 9 enables)

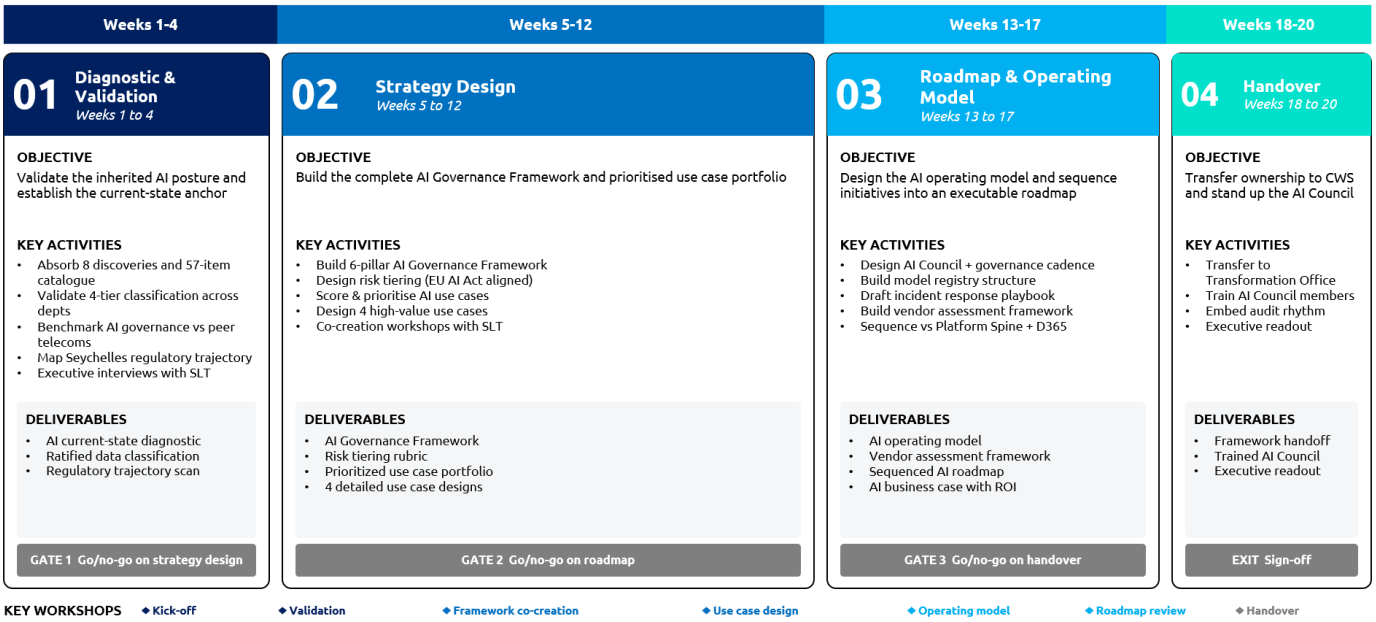

- Domain 4 (Customer Experience Transformation) receives the chatbot and virtual assistant governance treatment, the personalization and next-best-action risk tier assignments, and the customer AI consent framework.
- Domain 7 (Operational Efficiency and Automation) receives the AIOps governance model, the predictive maintenance use case design, and the guardrails for the intelligent automation wave in the enterprise automation heatmap.
- Domain 8 (Commercial Growth and Digital Revenue) receives the responsible data monetization controls, the AI-enabled commercial offerings governance treatment, and the vendor assessment framework for AI product partnerships.
- Domain 3 (Workforce Transformation and Upskilling) delivers the AI literacy and AI skills roadmap that Domain 9 specifies at the operating model level.

Phased Delivery

Domain 9 delivery is embedded within the four-phase engagement structure. Below is how each phase advances the Domain 9 outputs.

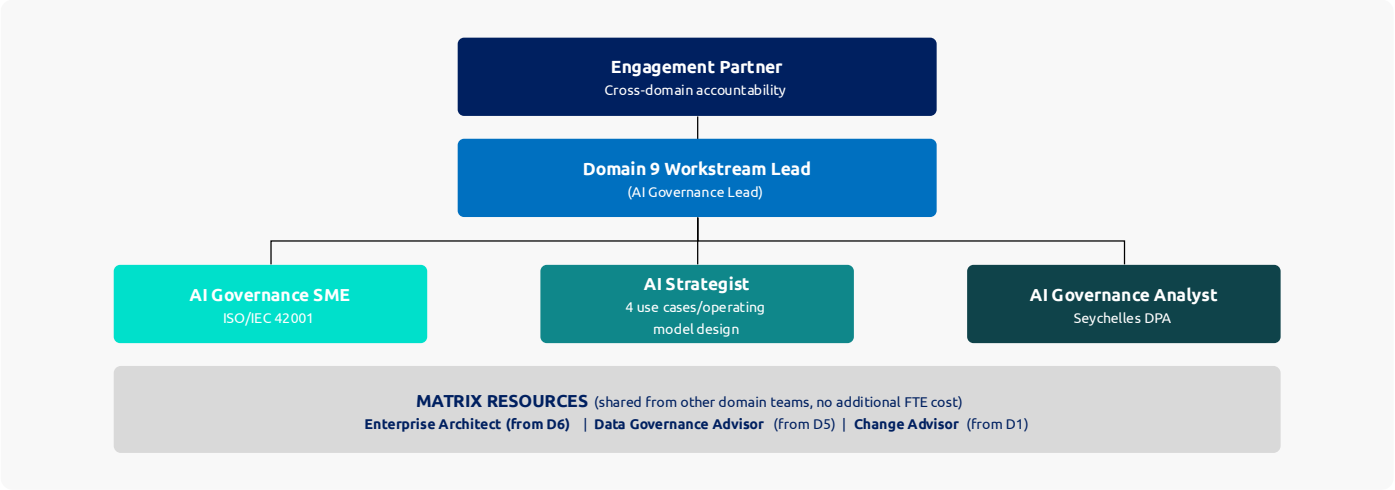

Domain 9 - Phased Delivery Roadmap

AI Strategy and Governance delivery across the 16 to 20 week engagement, with milestones, workshops, and phase gates

Phase	Weeks	Focus	Key Outputs
Phase 1. Diagnostic and Validation	1 to 4	Absorb the inherited AI posture, validate the four-tier data classification across departments, benchmark against comparable global telecoms, map the Seychelles regulatory trajectory	AI current-state diagnostic, ratified data classification scheme, regulatory trajectory assessment
Phase 2. Strategy Design	5 to 12	Build the complete AI Governance Framework, design the risk tiering methodology, prioritize the AI use case portfolio, produce use case designs for the four high-value candidates	AI Governance Framework, risk tiering rubric, prioritized AI use case portfolio, use case designs
Phase 3. Roadmap and Operating Model	13 to 17	Design the AI operating model, build the AI vendor assessment framework, sequence AI initiatives against the Platform Spine and D365 anchor, produce the AI business case	AI operating model, vendor assessment framework, sequenced AI roadmap, AI business case
Phase 4. Handover and Enablement	18 to 20	Transfer the framework and operating model to the CWS Transformation Office, run enablement sessions for the incoming AI Council members, embed the audit and transparency rhythm	Framework handoff package, trained CWS AI Council, executive readout

Delivery Team Structure

Role	Expertise/skill set
Engagement Partner	Cross-domain, named accountable
Workstream Lead	Delivery owner (AI Governance Lead)
AI Governance SME	ISO/IEC 42001 certified
AI Strategist	Designs 4 high-value use cases and operating model
AI Governance Analyst	Seychelles DPA, regulatory scan

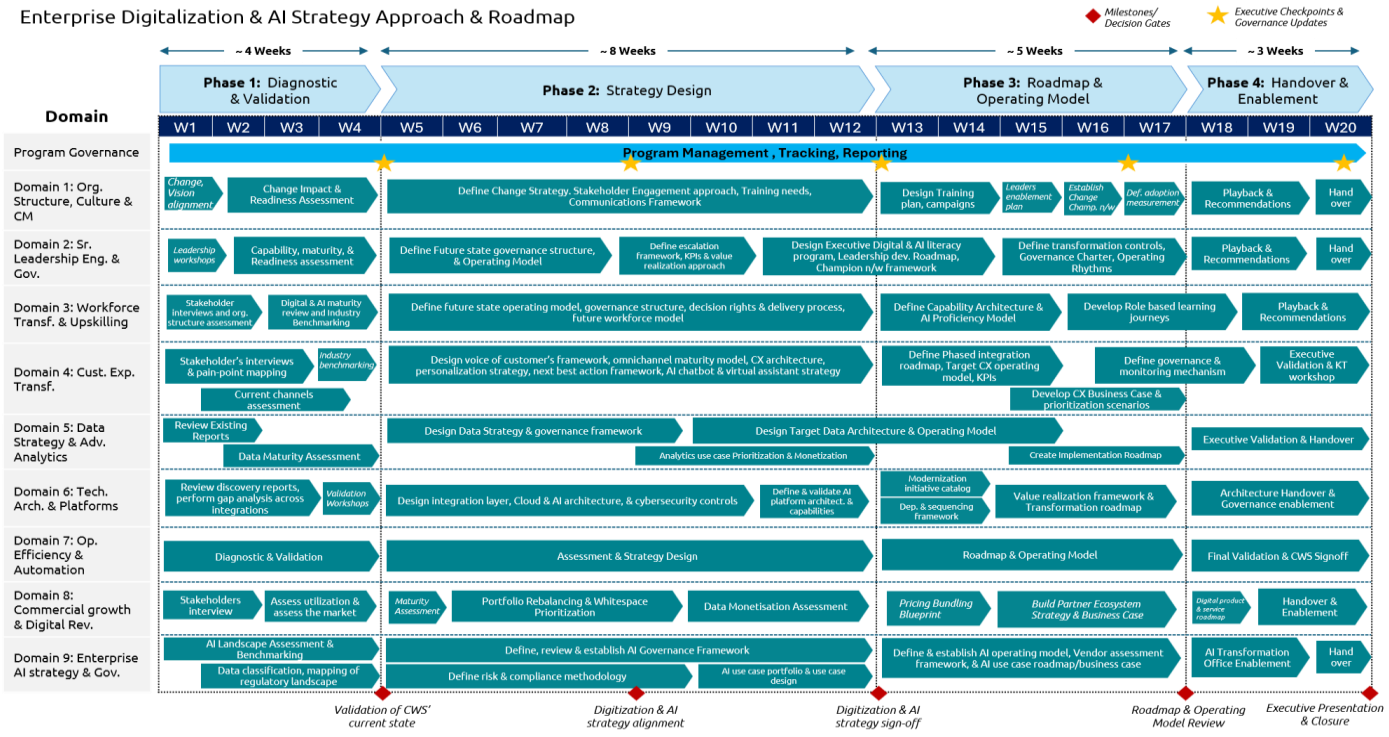

Value to CWS

Domain 9 outputs give CWS four things it does not have today:

- A complete, operable AI governance system that extends the CWS posture rather than replacing it.
- A prioritized, sequenced AI use case portfolio that honors the strategic principle of "Data before AI."
- An AI operating model that CWS's own team can run without ongoing consultant dependency.
- A regulatory trajectory assessment that positions CWS ahead of the Seychelles AI regulatory curve rather than reactive to it.

Taken together, these outputs make AI at CWS defensible to the Board, auditable by internal audit, credible with future regulators, and sequenced honestly against the Platform Spine.

4. Phases and Workplan

The proposed engagement plan for the 20-weeks digitalization & AI transformation program is designed to assess current organizational capabilities, define a future-state vision, and establish a practical roadmap for digital, data, and AI-led transformation.

The overall engagement is structured across four phases: **Diagnostic & Validation**, **Strategy Design**, **Roadmap & Operating Model Development**, and **Handover & Enablement**, ensuring a systematic transition from assessment to execution readiness.

The engagement plan covers all nine strategic domains, with a strong emphasis placed on establishing sustainable governance mechanisms, workforce enablement strategies, AI adoption frameworks, performance measurement approaches, and value realization models.

Executive checkpoints, project governance reviews, and decision gates are embedded throughout the engagement to ensure alignment with business objectives, stakeholder engagement, and effective risk management.

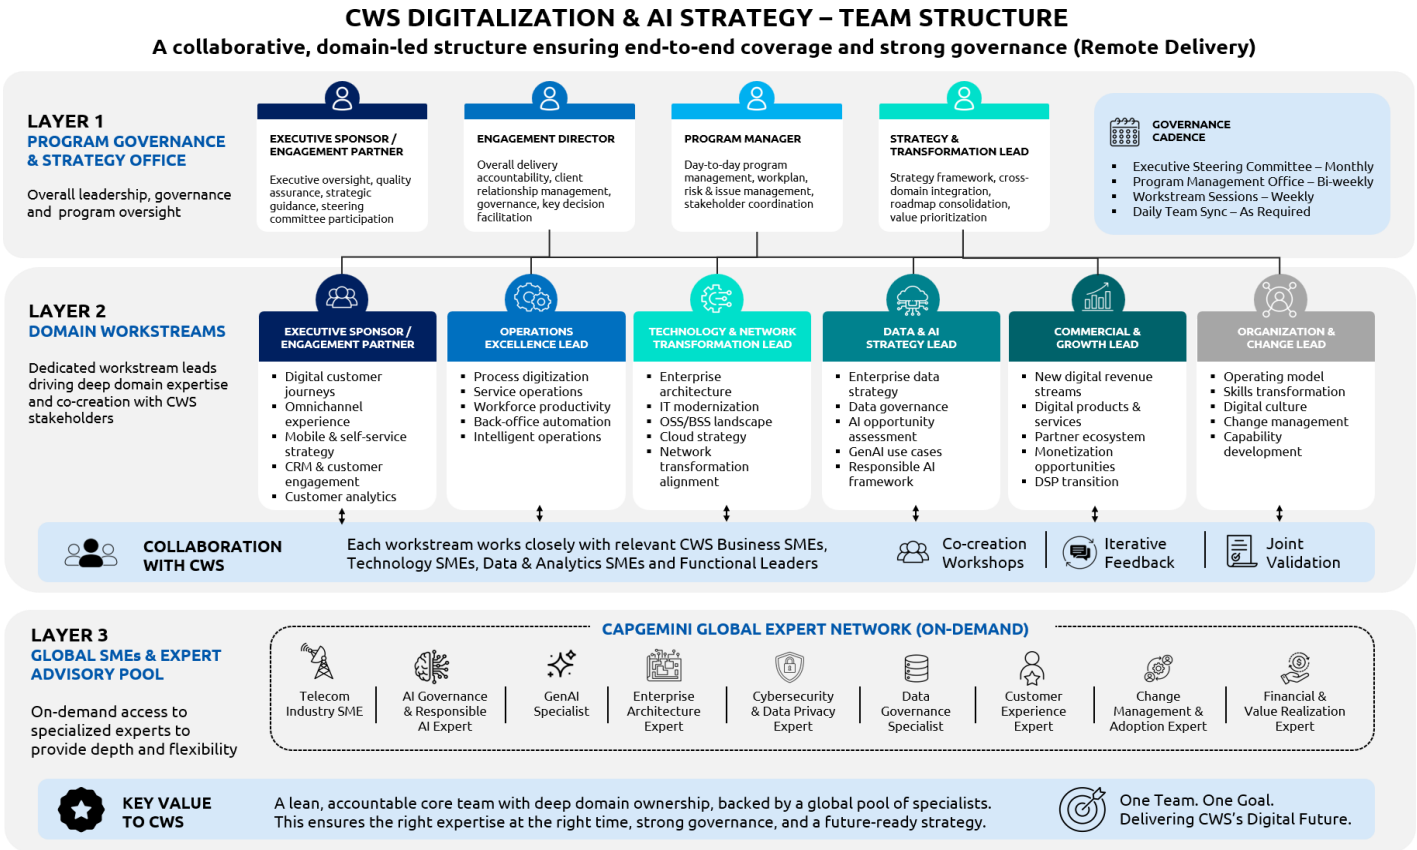

Expected Outcomes

Upon completion of the engagement, the organization will receive:

- A comprehensive assessment of current-state business, technology, data, customer experience, workforce, and AI capabilities, including identified gaps, risks, and improvement opportunities.
- A clearly defined future-state operating model and governance framework that supports enterprise-wide digital and AI transformation.
- A prioritized transformation roadmap with implementation phases, key milestones, dependencies, value realization metrics, and executive decision points.
- Strategic recommendations for workforce transformation, leadership enablement, change management, and capability development to improve organizational readiness and adoption.
- A data and analytics strategy, target architecture, and governance model to enable data-driven decision-making and advanced analytics capabilities.
- A customer experience transformation framework that enhances service delivery, personalization, omnichannel engagement, and AI-enabled customer interactions.
- An enterprise AI governance and operating framework, including risk management, compliance considerations, use-case prioritization, and AI adoption guidelines.
- Knowledge transfer, executive alignment, and enablement plans that equip stakeholders to successfully execute and sustain the transformation program beyond the engagement period.

Overall, our proposed approach will deliver a strategic transformation blueprint that provides the client with a clear vision, governance structure, capability roadmap, and actionable implementation plan to accelerate business growth, operational excellence, and responsible AI adoption.

7. Innovation and Value-Add

Capgemini believes that the most successful transformation strategies create value before implementation begins. For CWS, innovation is not about introducing emerging technologies in isolation—it is about helping CWS accelerate its transition from a traditional telecom operator to an AI-enabled Digital Service Provider (DSP) while respecting the guiding principles of Data before AI, Workflow before Automation, and Integration before Scale.

Our value-add extends beyond the production of a strategy document. We bring a combination of telecom industry expertise, global innovation assets, AI governance leadership, proven transformation frameworks, and practical accelerators that help de-risk execution and accelerate value realization. The Innovation and Value-Add element of our proposal focuses on five areas:-

a). Global Telecom Innovation Ecosystem - Capgemini provides access to one of the world's largest innovation networks through our Applied Innovation Exchange (AIE), Technology, Innovation and Ventures (TIV) organization, global telecom innovation labs, Generative AI Labs, 5G/6G Labs, and deep-technology capabilities from Cambridge Consultants. For CWS, this means access to:

- Telecom DSP transformation patterns from leading global operators.
- AI-enabled customer experience models.
- AIOps and predictive operations use cases.
- Advanced connectivity, digital platform and ecosystem business models.
- Emerging monetisation opportunities relevant to island economies and digital infrastructure providers.

b). CWS Innovation Portfolio Accelerator

As part of the engagement, we propose creating a CWS Innovation Portfolio that complements the existing 57-initiative catalogue and identifies a set of high-impact, future-focused opportunities beyond the current baseline. We will bring innovation thinking and practical recommendations beyond a generic strategy document. These opportunities would be assessed using a value-versus-feasibility framework and integrated into the roadmap only where they align with CWS priorities, governance requirements and platform readiness.

c). AI Factory and Use-Case Industrialisation - Most organizations struggle not with identifying AI use cases but with scaling them safely. CWS explicitly requires AI to become a core enterprise capability supported by governance, rather than a collection of disconnected experiments

To support this ambition, we will introduce a structured **AI Factory approach** that:

- Prioritizes use cases based on value, risk and feasibility.
- Aligns every AI initiative with enterprise data readiness.
- Embeds governance and risk controls from inception.
- Accelerates movement from pilot to enterprise deployment.
- Ensures alignment with ISO/IEC 42001, NIST AI RMF and emerging AI regulations.

This approach is particularly important for CWS because key strategic use cases such as AI chatbots, churn prediction, predictive maintenance and AIOps already form part of the platform spine and future transformation horizon.

d). Transformation Accelerators and Reusable Assets - Capgemini will leverage proven intellectual property, accelerators and frameworks developed across global transformation programmes.

Examples include:

- Applied Innovation Exchange (AIE) innovation methodology.
- Enterprise Data Strategy and Data Governance frameworks.
- Digital Maturity and AI Readiness assessment models.
- AI Governance Frameworks aligned with ISO/IEC 42001

e). Capability Building and Self-Sufficiency - A central objective of the CWS transformation is reducing long-term dependency on external vendors while building internal digital capability.

Accordingly, our innovation approach includes:

- Executive AI and digital leadership sessions.
- Innovation ideation workshops with CWS teams.
- Capability transfer embedded within every domain.
- Innovation playbooks and reusable toolkits.

Our goal is not merely to define innovation opportunities, but to equip CWS with the capability, governance and operating model required to continuously identify, evaluate and operationalise innovation long after the engagement concludes.

To conclude, Capgemini will help CWS establish the innovation engine required to become Seychelles' leading AI-enabled Digital Service Provider—combining global telecom experience, AI governance leadership, innovation ecosystems, transformation accelerators and capability transfer into a practical, execution-ready roadmap.

We are confident that this directly addresses the RFP requirement for **market insight, AI use-case thinking, digital infrastructure opportunities, innovative operating models and practical recommendations beyond a generic strategy document**

8. AI Governance Methodology

Purpose and Scope

This section establishes two binding requirements simultaneously:

- An operational constraint on how Capgemini delivers this engagement, meaning our own tooling, team behaviors, data handling, and AI-assisted work must comply with the CWS AI governance posture from day one
- A strategic starting point, meaning the CWS AI governance framework we build in Domain 9 must extend the posture described in this section and not replace it.

This section addresses the operational constraint in full. It also describes the methodology by which we develop the frameworks that Domain 9 produces as outputs. Domain 9 describes what those frameworks contain. This section describes how we build them and how we behave while building them.

Consultant Delivery Compliance with CWS AI Governance Requirements

Our binding commitment: Capgemini considers governance posture in this section as non-negotiable and applies it to our own delivery practices from engagement start. Every AI-assisted task, every tool we use, and every data flow we create is designed to satisfy the sanctioned environment principle and the four-tier data classification scheme before work begins, not retrospectively.

Governance-first delivery principles: Five principles govern our behavior throughout the engagement:

1. No CWS data leaves a sanctioned environment. All CWS data, including working documents, analytical models, workshop outputs, and stakeholder interview notes, is processed exclusively within the environments defined in RFP section 8.2.
2. AI tooling is disclosed before use. Every AI-assisted tool the delivery team intends to use is disclosed to the CWS engagement sponsor in writing before it is applied to any CWS data, meaning the tool name, its purpose in our workflow, the model provider, the hosting jurisdiction, its data retention and training-on-input policies, and the data classification tier it is approved to handle.
3. The delivery team is trained on the CWS governance posture. Every named team member receives a mandatory briefing on the CWS sanctioned environment principle, the four-tier data classification, the prohibited uses, and the CWS-specific handling rules. This briefing is completed before the team member touches CWS data or joins a CWS workshop.
4. Our compliance is monitored, not assumed. AI Governance lead within the engagement team is responsible for continuous monitoring of team behavior, tool inventory, and data flow against the compliance baseline.
5. The delivery team is held accountable. Any team member found to have processed CWS data outside a sanctioned environment or violated the RFP Section 8.3 prohibited uses is removed from the engagement immediately.

Sanctioned AI Environments and Prohibited Use Controls

Sanctioned environments used in delivery: For this engagement we operate within four environments only, aligned to RFP Section 8.2. These are our defaults with no exceptions unless CWS provides prior written approval.

The CWS Microsoft 365 commercial tenant, used for all working documents, analytical spreadsheets, workshop artefacts, and collaborative drafting. This is our primary environment.

Microsoft Copilot services operating within the CWS tenant boundary, used only where Copilot is enabled by CWS for the tenant, and only for tasks CWS has explicitly authorized.

Microsoft Azure under the CWS enterprise agreement, used only if analytical or modelling work requires compute or storage beyond M365 capacity. Any Azure resource we provision is provisioned within the CWS subscription, not a Capgemini subscription, and is subject to CWS network and identity controls.

CWS on-premise infrastructure, used only where highly regulated data requires on-premise handling, and only under CWS IT Operations supervision.

Prohibited use controls: In addition to the RFP Section 8.3 prohibitions listed above, we apply the following controls to our own delivery.

- We do not install any Capgemini-managed AI plugin, extension, or connector into the CWS M365 tenant without CWS IT Security review and written approval. We do not configure Copilot in ways that route CWS data through non-CWS services.
- We do not use browser-based AI assistants (writing helpers, code helpers, meeting summarizers) that inject CWS data into public model APIs.
- We do not use AI-assisted transcription services on CWS meetings unless the service runs within the CWS M365 tenant boundary, meaning Teams-native transcription with tenant-controlled retention.
- We do not use AI-assisted code generation tools on any script, macro, or analytical model that processes CWS data unless the tool operates within the CWS tenant or Azure subscription.

Technical controls: We enforce the above through three mechanisms.

- Endpoint policy on delivery team laptops, restricting installation of AI browser extensions and unsanctioned AI applications during the engagement.
- Network policy for team members working from Capgemini offices, preventing outbound connections to prohibited AI service endpoints for the duration of the engagement.
- Periodical audit by the compliance team to verify policy adherence.

Auditability: CWS retains absolute audit rights over our AI utilization throughout and post-engagement, per RFP Section 8.8. We commit to providing on-demand access to the engagement AI usage log, the compliance reports, the endpoint policy configuration, and any tool disclosure records.

AI Data Classification and Processing Approach

We adopt the RFP Section 8.4 four-tier data classification scheme for our delivery. Every CWS data element we handle is classified against the scheme before we work with it, and the classification determines which environment, tool, and process the data can flow through.

Tier-specific handling protocols: The table below defines how each tier is processed by our delivery team.

Tier	Classification	Handling Protocol
Tier 1	Public	Any sanctioned environment permitted. AI tooling permitted within sanctioned boundaries.
Tier 2	Internal	CWS M365 tenant or CWS Azure only. Copilot permitted within CWS tenant. External AI services prohibited.
Tier 3	Confidential	CWS M365 tenant or CWS Azure only. Copilot permitted only where contractual model-training exclusion is confirmed in writing. External AI services are prohibited. AI-assisted authoring must log the specific document and purpose.
Tier 4	Regulated (Customer, Billing, CDR)	On-premise or CWS-controlled infrastructure only. AI processing restricted to demonstrably isolated environments with audit logging. No AI-assisted analysis without prior CWS Engagement Sponsor and DPO written approval per instance.

Classification workflow: Every workshop output, interview transcript, analytical model, and draft deliverable is tagged with its highest-tier data element on creation. The tag determines who may access it, which environment stores it, and which AI tooling may touch it.

Data flow diagram: A comprehensive data flow diagram covering every CWS data category we handle, its origin, its processing environment, its output form, and its retention rule is provided to the CWS Engagement Sponsor The diagram is updated whenever a new data category enters our workflow.

Cross-border data transfer: No CWS customer data is processed by AI services hosted outside jurisdictions with data protection regimes equivalent to the Seychelles Data Protection Act. Our default hosting jurisdictions for AI processing are within the Azure geography assigned to the CWS enterprise agreement. Where a specific analytical task requires a service hosted outside that geography, we request CWS written approval before use.

AI Risk Management Methodology

Standards alignment: Our AI risk management aligns with three international standards named in RFP Section 8.7. NIST AI RMF v1.0 provides the operational risk functions (Govern, Map, Measure, Manage). ISO/IEC 42001 provides the AI management system requirements that make governance an ongoing system rather than a one-time deliverable. The EU AI Act 2024 provides the four-tier risk classification (unacceptable, high, limited, minimal) that shapes the CWS-facing risk tiering methodology in Domain 9 Building Block 2, serving as the de facto framework in the absence of local Seychelles AI legislation.

Methodology for building the CWS framework: Five sequential steps:

1. Absorb the RFP Section 8 posture in full and extend it. Nothing in the CWS framework contradicts the inherited baseline.
2. Validate the four-tier scheme across all CWS departments to identify where policy diverges from practice.
3. Map every framework element to specific NIST AI RMF functions, ISO/IEC 42001 clauses, and EU AI Act articles, documented in a compliance traceability matrix.
4. Adapt to the Seychelles context, meaning the Data Protection Act, telecom sector confidentiality, and anticipated local AI regulation.
5. Validate every element through co-creation workshops with CWS leadership before it enters the final artefact.

Our own risk management during delivery: Every AI-assisted task is classified against the EU AI Act tiers. Higher-tier tasks require escalated approval, meaning Tier 3 stakeholder transcript summarization requires sign-off and Tier 4 activities require CWS Engagement Sponsor approval per instance.

Incident response and consent framework methodology: The CWS incident response model (Domain 9 deliverable) follows a four-phase approach, meaning classification, containment, remediation, and lessons learned. We apply the same protocol to our own delivery. The customer AI consent framework draws on the Seychelles Data Protection Act, telecom sector precedent, and GDPR-equivalent design patterns covering transparency, purpose limitation, right to explanation, and right to human review.

AI Use-Case Prioritization Framework

The prioritized use case portfolio itself is a Domain 9 output. This section defines the methodology by which we develop it.

Every candidate use case from the CWS 57-item catalogue is scored against three axes. Value is scored against the three strategic pillars (CX 40%, revenue 35%, efficiency 30%) and specific business case metrics. Risk is scored against the EU AI Act tier, the data classification tiers involved, and the sanctioned environment fit. Feasibility is scored against Platform Spine readiness, data

foundation readiness (Domain 5 dependency), technology architecture readiness (Domain 6 dependency), and operating model readiness.

Sequencing respects the CWS strategic principle. No use case is scheduled ahead of the foundation it depends on. Where the foundation is not yet ready, the use case is phased into a later wave.

The workflow runs across Phase 2 of the engagement with intermediate validation workshops. Every prioritized use case carries an attached governance treatment aligned to its risk tier, meaning the specific controls that apply if it moves to deployment. This is what makes the portfolio execution-ready rather than aspirational.

AI Vendor and Platform Assessment Framework

We develop the framework by which CWS assesses AI vendors going forward. We do not select vendors during this engagement.

The framework structures assessment against six criteria groups:

1. Data governance covers data flow direction, residency, encryption, retention, and deletion.
2. Model provider and training cover the underlying model, training on customer inputs, and version control.
3. Sanctioned environment fit covers whether the service operates within CWS-controlled boundaries.
4. Security and compliance cover certifications, regulatory posture, incident history, and audit rights.
5. Contractual protections cover model-training exclusion, data use restrictions, and termination provisions.
6. Operational fit covers integration with the CWS Azure and M365 environments.

Scoring is weighted by the risk tier of the use case the vendor is being assessed for. Higher-risk use cases apply stricter thresholds, and below-threshold vendors are disqualified regardless of overall score. The framework is co-authored with Domain 6 to ensure consistency with the target architecture.

AI Incident Response, Auditability, and Transparency Model

Three transparency behaviors apply throughout our delivery:

1. Every AI-assisted contribution to a deliverable is disclosed in the deliverable itself, meaning the tool used, the input, and the reviewer.
2. Every framework and analytical model is delivered with the full methodology visible, meaning no black-box outputs.
3. Every strategic recommendation is traceable to the workshops and data reviews that produced it.

Any suspected data flow to an unsanctioned environment, unauthorized AI tool use, data classification breach, or AI-generated output containing customer or regulated data triggers our incident response protocol, notification to the CWS Engagement Sponsor, investigation with named investigator, remediation plan, and lessons-learned report within agreed timelines.

CWS holds absolute audit rights over our AI utilization per RFP Section 8.8. On request, we provide the engagement AI usage log, tool inventory, data flow diagrams, compliance reports, team training records, and incident logs.

The framework we build for CWS in Domain 9 mirrors the structure we apply to ourselves, covering incident classification and escalation, containment and remediation playbooks, audit log design, transparency requirements for deployed AI systems, customer-facing disclosure obligations, and lessons-learned integration.

Governance for Framework Development

Three safeguards apply to how we develop the CWS AI governance framework:

1. Co-creation, not delivery: Every framework element is developed with CWS leadership through structured workshops. We do not draft in isolation and present at handover.
2. Phase-gate validation: The framework is validated at three gates, meaning end of Phase 1 (posture ratified), end of Phase 2 (structure agreed), and end of Phase 3 (operating model complete). CWS holds veto at each gate.
3. Standards traceability: Every framework element maps to a specific NIST AI RMF function, ISO/IEC 42001 clause, EU AI Act article, or CWS-inherited posture element, documented in a compliance traceability matrix.

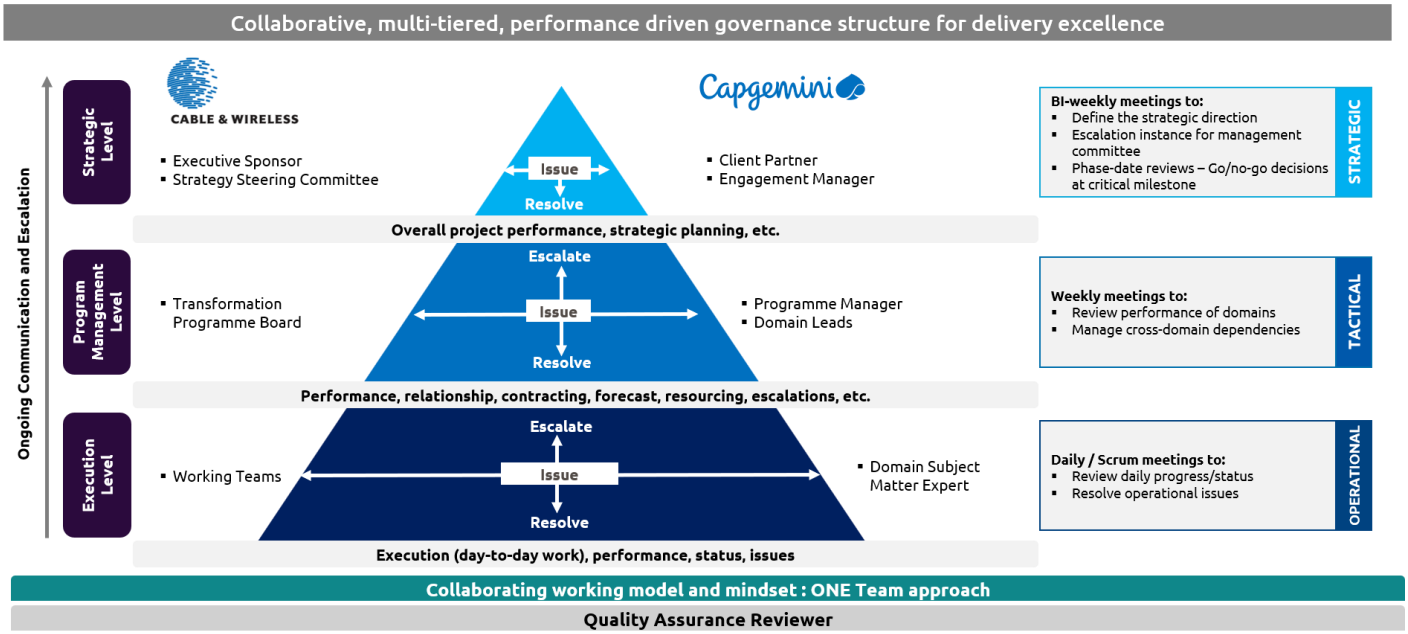

At engagement close, ownership transfers fully to CWS with three transfer artefacts, meaning the framework document, the methodology and traceability matrix, and a trained AI Council capable of operating and extending the framework without Capgemini dependency.

9. Governance Model

Capgemini proposes a collaborative **"One Team" operating model** with CWS, designed to foster close alignment, transparency, and shared accountability across all stakeholders. As this engagement is primarily consultative in nature, we recommend a **lean governance structure** rather than the more extensive governance typically associated with large-scale delivery programmes.

The model is structured across three levels—Strategic, Program Management, and Execution—as illustrated below.

CAPGEMINI'S THREE-TIER GOVERNANCE STRUCTURE

This tiered approach provides clear ownership and decision-making authority while ensuring effective collaboration across the engagement.

At the Strategic level, executive stakeholders from both organizations will provide overall direction, oversee progress against business objectives, and support key decisions. We propose incorporating phase-gate reviews into these forums to provide clear visibility of outcomes and enable timely go/no-go decisions at critical milestones.

The Strategic level will be led by an Engagement Manager, who will provide overall engagement oversight, executive stakeholder management, and governance leadership. Supporting this role, a Programme Manager will coordinate activities across domains, manage cross-domain dependencies, drive issue resolution, and ensure alignment between teams.

At the Execution level, individual domain SMEs will lead their respective workstreams and be accountable for day-to-day delivery. Where support, escalation, or dependency management is required, they will engage the Project Manager to ensure timely resolution and continued progress.

To support effective governance and collaboration, we will establish a regular cadence of meetings at the strategic, tactical, and operational levels, including bi-weekly, weekly, and daily forums as appropriate. This will promote continuous communication, rapid issue resolution, and timely decision-making.

To maintain delivery quality and methodological rigor, an independent Quality Assurance reviewer, separate from the delivery team, will periodically review key deliverables, approaches, and outcomes. The QA reviewer will ensure adherence to the agreed methodology, challenge assumptions where required, and provide objective feedback to maintain consistency and quality throughout the engagement.

Overall, the proposed operating model provides a structured framework that supports effective risk management, quality assurance, and on-time delivery, while enabling the flexibility and responsiveness required for a successful consulting engagement.

10. Commercial Proposal

Commercial has been provided in separate excel document

11. Risks, Assumptions, Dependencies

11.1 Assumptions

1. The existing discovery outputs, including Annexures A and B, current-state assessments, technology landscape information, architecture discovery materials, and the initiative catalogue, are assumed to remain materially accurate and will be used as the primary baseline for validation and analysis.
2. Required business and operational data sources are assumed to be available, accessible, and usable for analysis, subject to CWS information security, privacy, confidentiality, data protection, and data governance requirements.
3. The target architecture, analytics strategy, automation roadmap, and AI-enabled operating model will align with CWS's guiding principle: "Data before AI. Workflow before automation. Integration before scale."

4. Strategic platforms including Cerillion, NI2, LATRO, Microsoft 365, CEM, Bon Espoir Data Centre, and the D365 F&O programme are assumed to remain key components of the future-state technology landscape during the strategy development period.
5. Ongoing transformation programmes, including D365 F&O and LATRO Phase 2, are assumed to continue according to their planned timelines and scope. Any material changes may require reassessment of sequencing, priorities, roadmap dependencies, and value realization assumptions.
6. The roadmap will leverage and extend existing investments such as LATRO, Cerillion, NI2, CEM, Microsoft 365, D365 F&O, and the Bon Espoir Data Centre while minimizing unnecessary platform replacement.
7. Cloud placement, hosting strategy, and workload deployment decisions may be influenced by data sovereignty, security, compliance, latency, resilience, operational criticality, workload characteristics, sanctioned environment requirements, and AI governance controls.
8. The assessment will focus on strategy-level data, analytics, architecture, process, workflow modernization, automation suitability, governance recommendations, prioritization, roadmap design, and value realization forecasting. Detailed technical solution design, implementation, testing, deployment, procurement execution, vendor negotiation, production support, and operational service management are excluded unless separately agreed.

11.2 Dependencies

1. CWS will need to provide timely access to relevant business, operational, financial, process, KPI, reporting, system, integration, architecture, security, and data information required to support analytics assessment, architecture design, automation prioritization, and value realization modelling.
2. CWS business, technology, security, architecture, network, finance, operations, transformation, and programme stakeholders will need to be available for interviews, workshops, architecture reviews, process validation sessions, roadmap discussions, and sign-off meetings.
3. Timely review, consolidated feedback, and formal sign-off from CWS will be required for findings, recommendations, roadmap outputs, architecture decisions, and value realization assumptions to avoid delays in the engagement timeline.
4. CWS will need to identify and allocate data owners and data stewards for critical data domains to support data governance, KPI alignment, data quality assessment, reporting consistency, and future analytics adoption.
5. Business SMEs will need to provide business context, KPI definitions, reporting requirements, operational pain points, process volumes, effort estimates, and value drivers to support analytics use-case prioritization and automation opportunity assessment.
6. Data quality improvement, master data governance, metadata standards, ownership models, and Enterprise Data Platform direction must be aligned before scaling analytics, automation, and AI initiatives.
7. The prioritization and sequencing of automation opportunities will depend on the Enterprise Data Strategy, Data Governance Framework, data quality priorities, and Enterprise Data Platform roadmap developed under Domain 5.
8. The target technology architecture and automation roadmap will depend on integration strategy, platform decisions, target architecture principles, and modernization sequencing developed under Domain 6.
9. AI-driven operations, intelligent automation, AI platform design, AI services architecture, and AI-enabled use cases will need to align with the AI Governance Framework, data classification model, sanctioned environment controls, responsible AI principles, and risk tiering developed under Domain 9.
10. The future-state architecture and technology roadmap must align with the ongoing D365 Finance & Operations implementation and the planned May 2027 go-live, particularly for finance, procurement, reporting, master data, and integration dependencies.
11. Architecture recommendations involving existing platforms will require validation through CWS-provided technical documentation, architecture workshops, system owner input, and where necessary, CWS-facilitated engagement with relevant vendors.

11.3 Risks

1. Inadequate data governance, unclear ownership, fragmented stewardship, inconsistent master data, and poor data quality may result in inconsistent metrics, poor reporting quality, reduced trust in analytics outputs, limited integration effectiveness, and lower AI readiness.
2. Any material change to CWS business priorities, operating model, transformation timelines, technology programmes, governance structures, strategic direction, or requests for deeper technical analysis, additional workshops, vendor evaluation, SOP development, or support beyond the agreed strategy advisory scope may require reassessment of roadmap sequencing, priorities, scope, timeline, commercials, and assumptions through formal change control.

12. Conflict of Interest and AI Transparency Disclosures

12.1 Conflict of Interest Declaration

Capgemini confirms that, to the best of our knowledge at the time of submission, there are no actual conflicts of interest that would impair our ability to provide independent, objective, and impartial advisory services to Cable & Wireless Seychelles (CWS).

Capgemini acknowledges that this engagement is a strategic advisory assignment and commits to acting solely in the best interests of CWS throughout the engagement.

Existing Industry Relationships

As a global consulting and technology services organization, Capgemini maintains relationships with numerous telecommunications operators, technology vendors, cloud providers, software vendors, and telecommunications ecosystem partners worldwide. Such relationships do not influence our recommendations and do not compromise our independence in providing advice to CWS. All recommendations provided during this engagement will be based solely on:

- CWS business objectives
- Strategic value realization
- Technical suitability

- Operational feasibility
- Regulatory compliance considerations
- Cost-benefit and risk assessments

Any potential conflicts identified during the engagement will be disclosed immediately to CWS and managed through agreed governance arrangements.

12.2 Technology Vendor Relationships

Capgemini maintains strategic alliance partnerships with several technology providers, including but not limited to:

- Microsoft
- Salesforce
- ServiceNow
- SAP
- Oracle
- AWS
- Google Cloud
- IBM
- Snowflake
- Databricks
- Cybersecurity platform providers

These alliances support certification programs, solution development, training, innovation initiatives, and technology implementation capabilities.

Capgemini confirms that:

- No specific technology vendor has been pre-selected for recommendation to CWS.
- Recommendations contained within this strategy engagement will remain vendor-neutral and outcome-driven.
- Any technology options assessed during the engagement will be evaluated against defined business, technical, security, data sovereignty, AI governance, cost, and operational criteria.

CWS retains full authority over any future vendor or platform selection decisions.

12.3 Relationships with Existing CWS Ecosystem Vendors

Capgemini recognizes that CWS currently operates or is engaged with several strategic technology partners and platforms, including but not limited to:

- Microsoft
- Cerillion
- LATRO
- D365 Finance & Operations implementation partners
- Other OSS/BSS, network and application vendors

Capgemini confirms that:

- This engagement does not create any commercial obligation towards any existing CWS technology supplier.
- Any future recommendations involving these platforms will be based on objective assessment and business value.
- All assessments will consider reuse, optimization, integration, modernization and replacement options where appropriate.

12.4 AI Services, Tools and Models Used in Engagement Delivery

Capgemini fully complies with the CWS requirement that all AI tools used during engagement delivery must be disclosed and continuously reported.

The following categories of AI-enabled tools may be utilized during delivery, subject to CWS approval and sanctioned-environment controls.

Tool Category	Example Platform	Purpose
Productivity AI	Microsoft Copilot	Document drafting, summarization, meeting preparation
Collaboration AI	Microsoft Teams AI capabilities	Meeting transcription and collaboration support
Research & Knowledge Management	Capgemini-approved internal knowledge platforms	Research acceleration and asset discovery
Data & Analytics AI	Microsoft Azure AI Services (if approved)	Analysis and modelling support
AI-Assisted Analysis	Azure OpenAI Services, Azure AI Studio	Architecture analysis, use-case assessment, strategy development, business analysis, insight generation and AI solution evaluation
AI Prototyping & Innovation	Microsoft Copilot Studio	Rapid prototyping of AI assistants, workflow automation concepts and future-state AI use cases
Creative & Visual Design AI	Adobe Firefly	Creation of presentation visuals, conceptual graphics, workshop materials and communication assets
Internal Capgemini Tools	Internal AI accelerators and automation tools	Productivity and delivery acceleration

Commitment

Capgemini commits that:

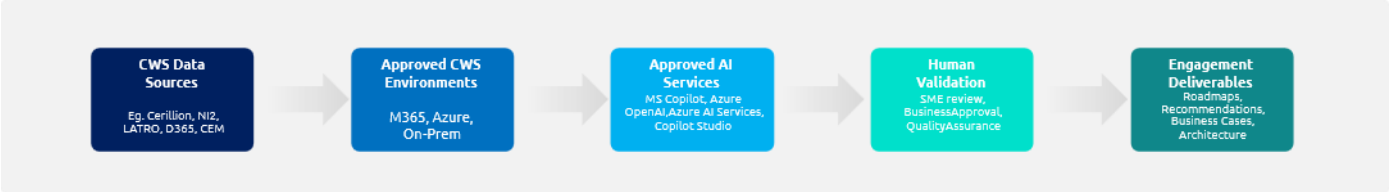

- CWS data will only be processed within sanctioned environments approved by CWS.
- No customer, billing, or regulated data will be submitted to consumer-grade AI services.
- No public AI service will be used for processing CWS regulated information.
- AI-assisted activities will remain subject to human review and validation.
- Full transparency will be maintained regarding AI utilization throughout the engagement.

12.5 Model Providers, Hosting Locations and Data Processing Approach

In alignment with the CWS AI Governance requirements and sanctioned environment model, Capgemini proposes the following principles:

Approved Processing Locations

- CWS Microsoft 365 Tenant
- CWS Microsoft Copilot Environment
- CWS Azure Tenant / Enterprise Agreement
- CWS On-Premise Infrastructure
- Other locations only with explicit written approval from CWS

Key controls include:

- No public AI model training on CWS data.
- Data residency and sovereignty controls.
- Role-based access management.
- Full audit logging.
- Data classification enforcement.

12.6 AI-Assisted Analysis and Authoring Tools

Where AI-assisted tools are utilized during delivery, they will be limited to:

- Document drafting support
- Content summarization
- Workshop preparation
- Research support
- Analysis acceleration
- Knowledge retrieval

All recommendations, findings, analyses, assessments and deliverables will remain subject to expert review by Capgemini consultants. No strategic recommendation will be generated or delivered without human validation and approval.

Since the proposed services will be consultancy based, the only AI tool involved will potentially be MS CoPilot, which is a dedicated Capgemini enterprise version and has been cyber risk assessed to minimize any potential security issues from occurring.

12.7 AI Certifications and Governance Credentials

Capgemini maintains extensive AI governance, risk management and responsible AI capability.
The proposed team includes specialists with qualifications and experience across:

- ISO/IEC 42001 Artificial Intelligence Management Systems
- NIST AI Risk Management Framework (AI RMF)
- Responsible AI Governance
- AI Ethics
- Enterprise AI Strategy
- MLOps and AI Platform Design
- Data Governance and Privacy
- Cybersecurity Architecture

12.8 AI Certifications and Accreditation Portfolio

Capgemini maintains a robust AI talent ecosystem supported by 300+ unique AI-related certifications spanning Generative AI, Machine Learning, Large Language Models (LLMs), Agentic AI, Responsible AI, AI Governance, Prompt Engineering, Data Science, MLOps, and Enterprise AI platforms.

Our professionals hold industry-recognized certifications from leading technology providers, including Microsoft, Google Cloud, AWS, Oracle, NVIDIA, Databricks, Salesforce, IBM, Dataiku, and Adobe, reflecting deep expertise across AI strategy, architecture, engineering, implementation, and governance.

In addition, Capgemini professionals hold industry-recognized AI and cloud certifications across leading technology ecosystems, including:

- Microsoft Azure AI Engineer Associate
- Microsoft Applied Skills for Generative AI and Copilot
- AWS Certified Machine Learning and Generative AI Certifications

- Google Cloud Professional Machine Learning Engineer
- Data Science and Machine Learning Certifications
- AI Governance and Responsible AI Accreditations
- Enterprise Architecture Certifications supporting AI-led transformation (e.g., TOGAF)
- Agile and Product Management Certifications supporting AI product delivery

12.9 AI Security and Data Protection Incident Declaration

Capgemini confirms that it has not experienced any AI-related data protection, cybersecurity, or security incidents involving Capgemini or its authorized sub-processors within the preceding 24 months that would materially impact the delivery of services or compromise client data.

Capgemini maintains robust enterprise-wide information security, privacy, and data protection governance frameworks, supported by established risk management, monitoring, and incident response processes. Any material security or data protection incident requiring notification under applicable contractual, legal, or regulatory obligations would be disclosed in accordance with such obligations.

Should any relevant incident occur during the course of the engagement, the client will be notified in accordance with agreed governance procedures and contractual requirements.

12.10 Transparency and Audit Rights

Capgemini acknowledges and accepts the CWS right to:

- Audit AI usage throughout the engagement
- Request disclosure of AI tools and models utilized.
- Review data processing practices.
- Verify compliance with sanctioned environment requirements.
- Review AI governance controls and delivery processes.

Capgemini will maintain appropriate documentation, audit records and disclosure logs to support these requirements throughout the engagement.

12.11 Commitment to Transparency, Responsible AI and Data Sovereignty

Capgemini is committed to delivering this engagement with complete transparency, independence and compliance with the AI Governance, Data Sovereignty and Vendor Disclosure requirements defined by Cable & Wireless Seychelles. All AI usage, technology assessments, vendor recommendations and consulting activities will remain fully auditable, human-governed and aligned to CWS's principle of **"Data before AI. Workflow before automation. Integration before scale."**

About Capgemini

Capgemini is an AI-powered global business and technology transformation partner, delivering tangible business value. We imagine the future of organizations and make it real with AI, technology and people. With our strong heritage of nearly 60 years, we are a responsible and diverse group of over 420,000 team members in more than
50 countries. We deliver end-to-end services and solutions with our deep industry expertise and strong partner ecosystem, leveraging our capabilities across strategy, technology, design, engineering and business operations. The Group reported 2025 global revenues of €22.5 billion.

Make it real. | www.capgemini.com
